

CSCI-351

Data communication and Networks

Lecture 3: Internet Architecture **(Big picture of how Internet works)**

Recap

2

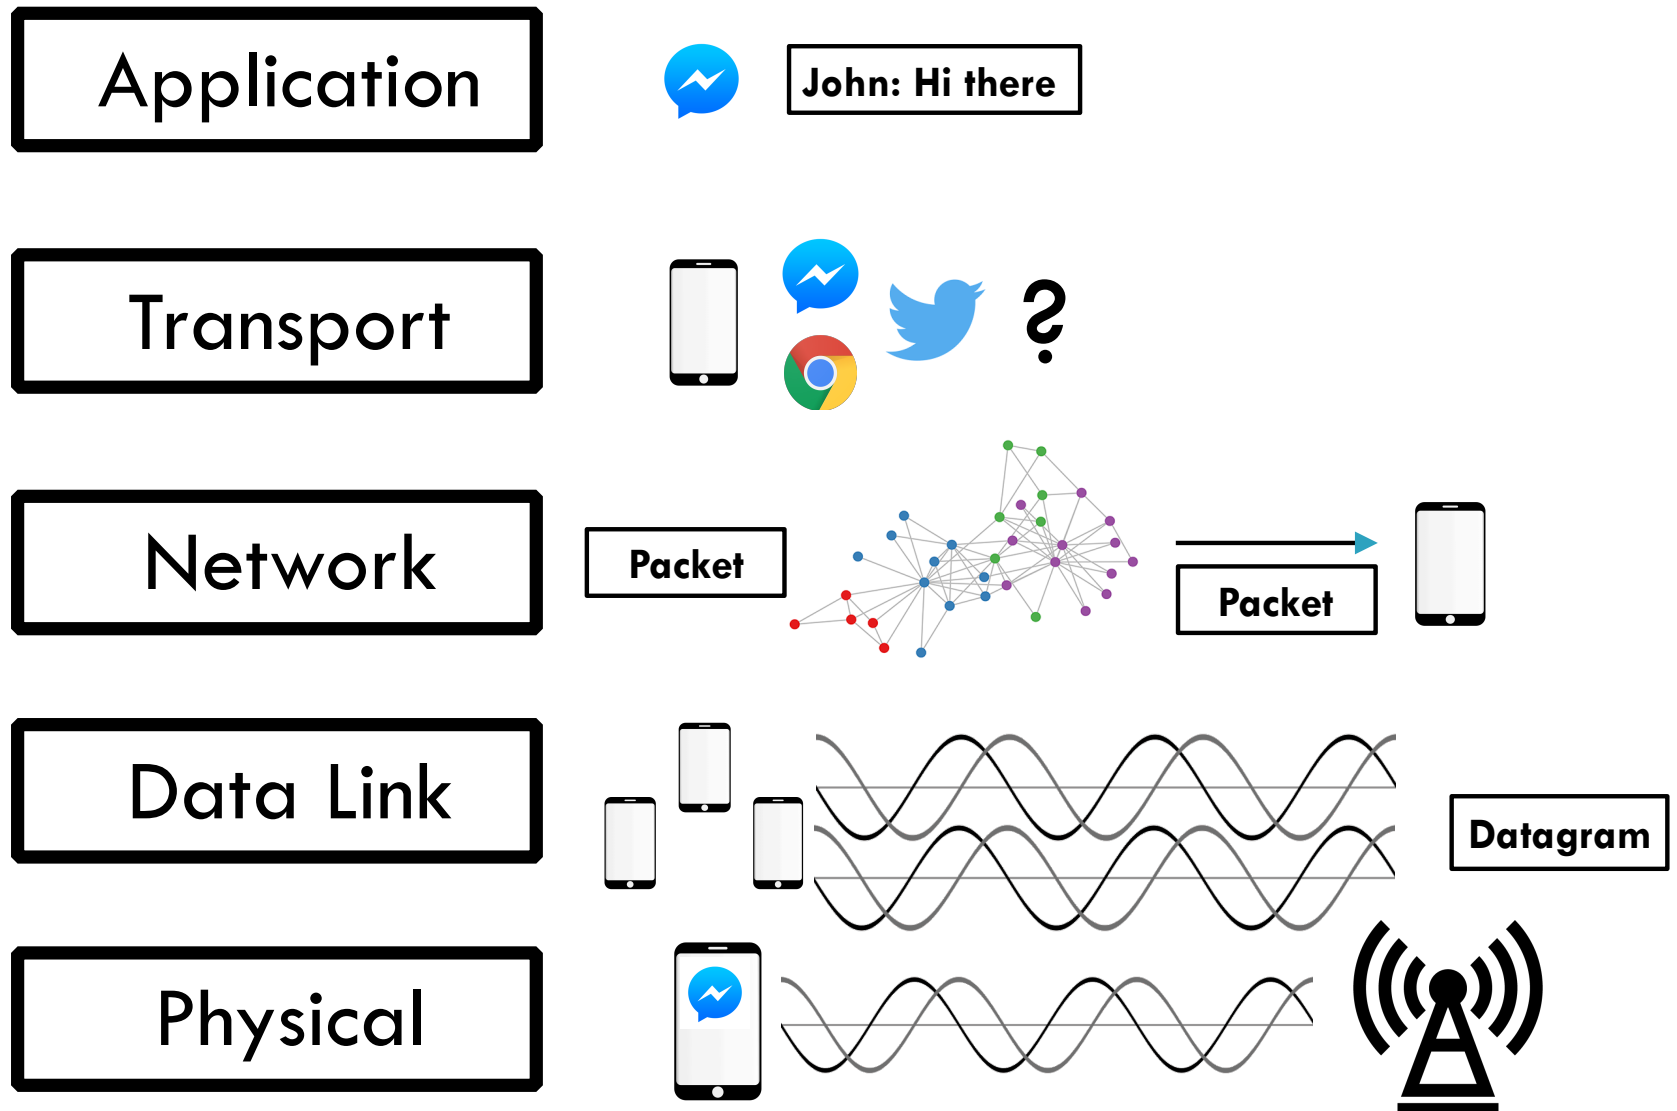

Okay, what are we going to study?

3

Okay, what are we going to study?

4

CSCI-351

Data communication and Networks

Lecture 3: Internet Architecture **(Big picture of how Internet works)**

Organizing Network Functionality

6

- Networks are built from many components

- ▣ Networking technologies

- Ethernet, Wifi, Bluetooth, Fiber Optic, Cable Modem, DSL

- ▣ Network styles

- Circuit switch, packet switch
 - Wired, Wireless, Optical, Satellite

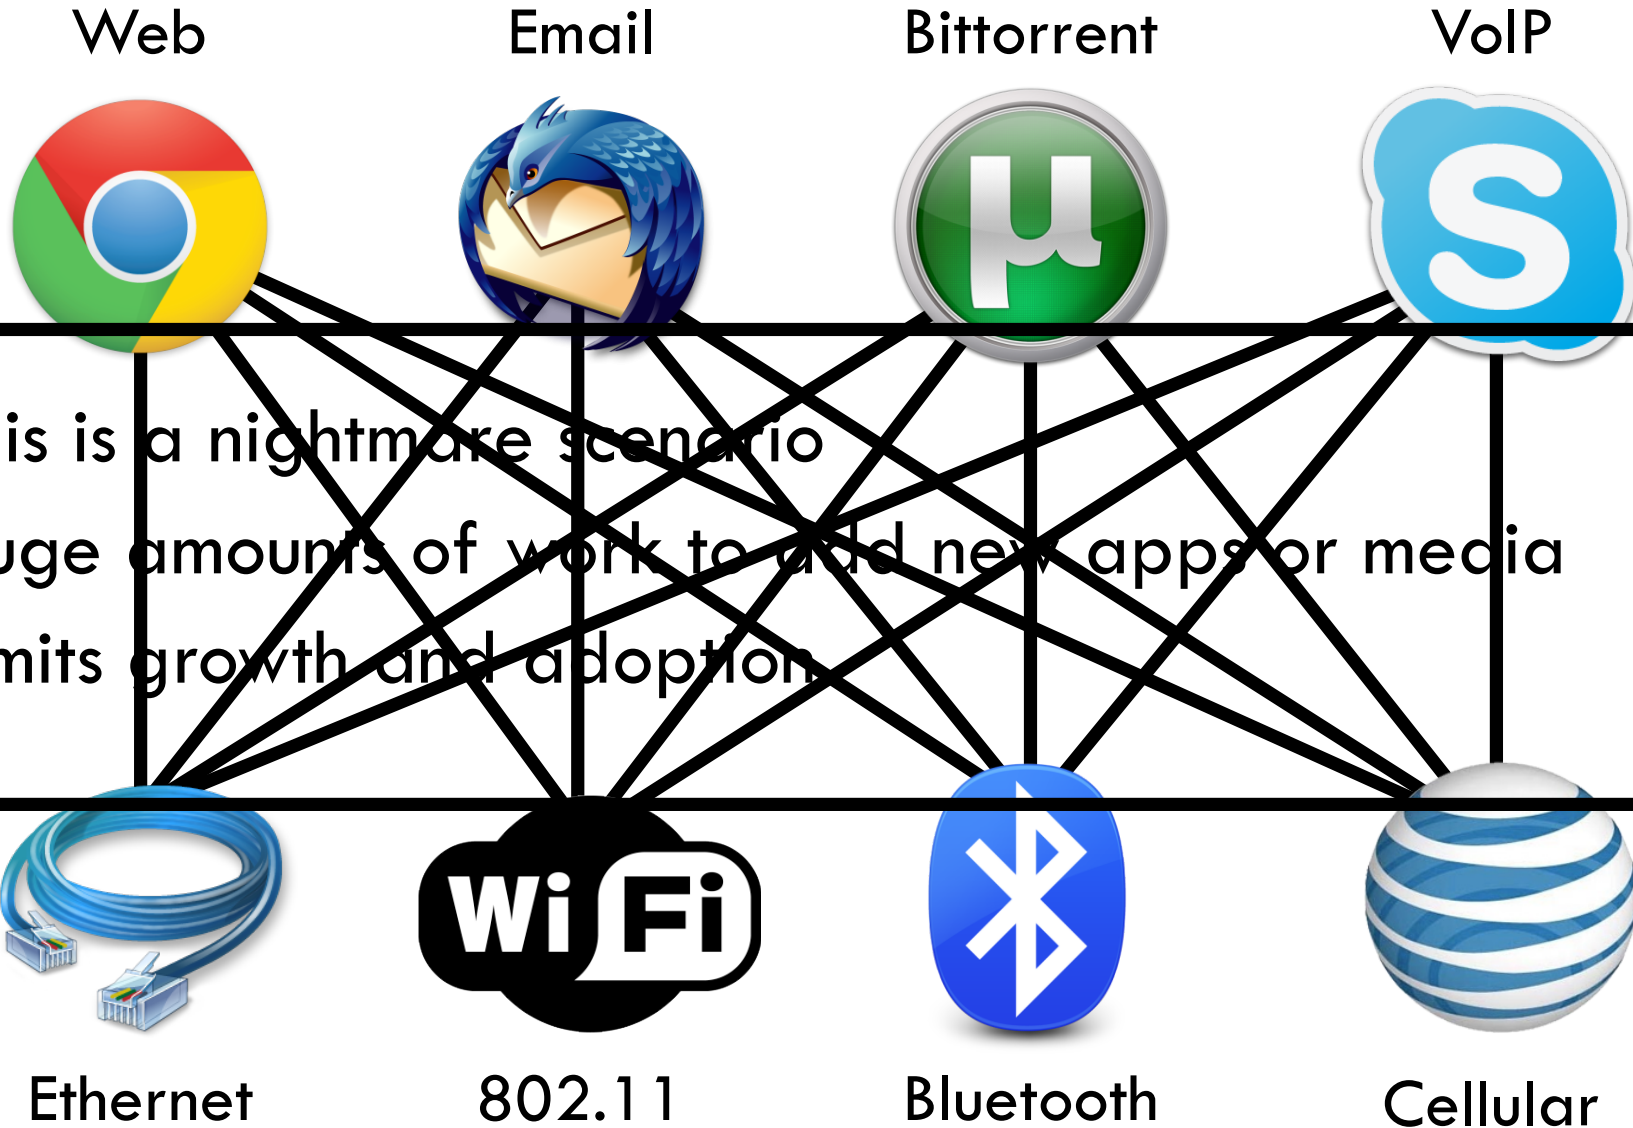

- ▣ Applications

- Email, Web (HTTP), FTP, BitTorrent, VoIP

- How do we make all this stuff work together?!

Problem Scenario

7

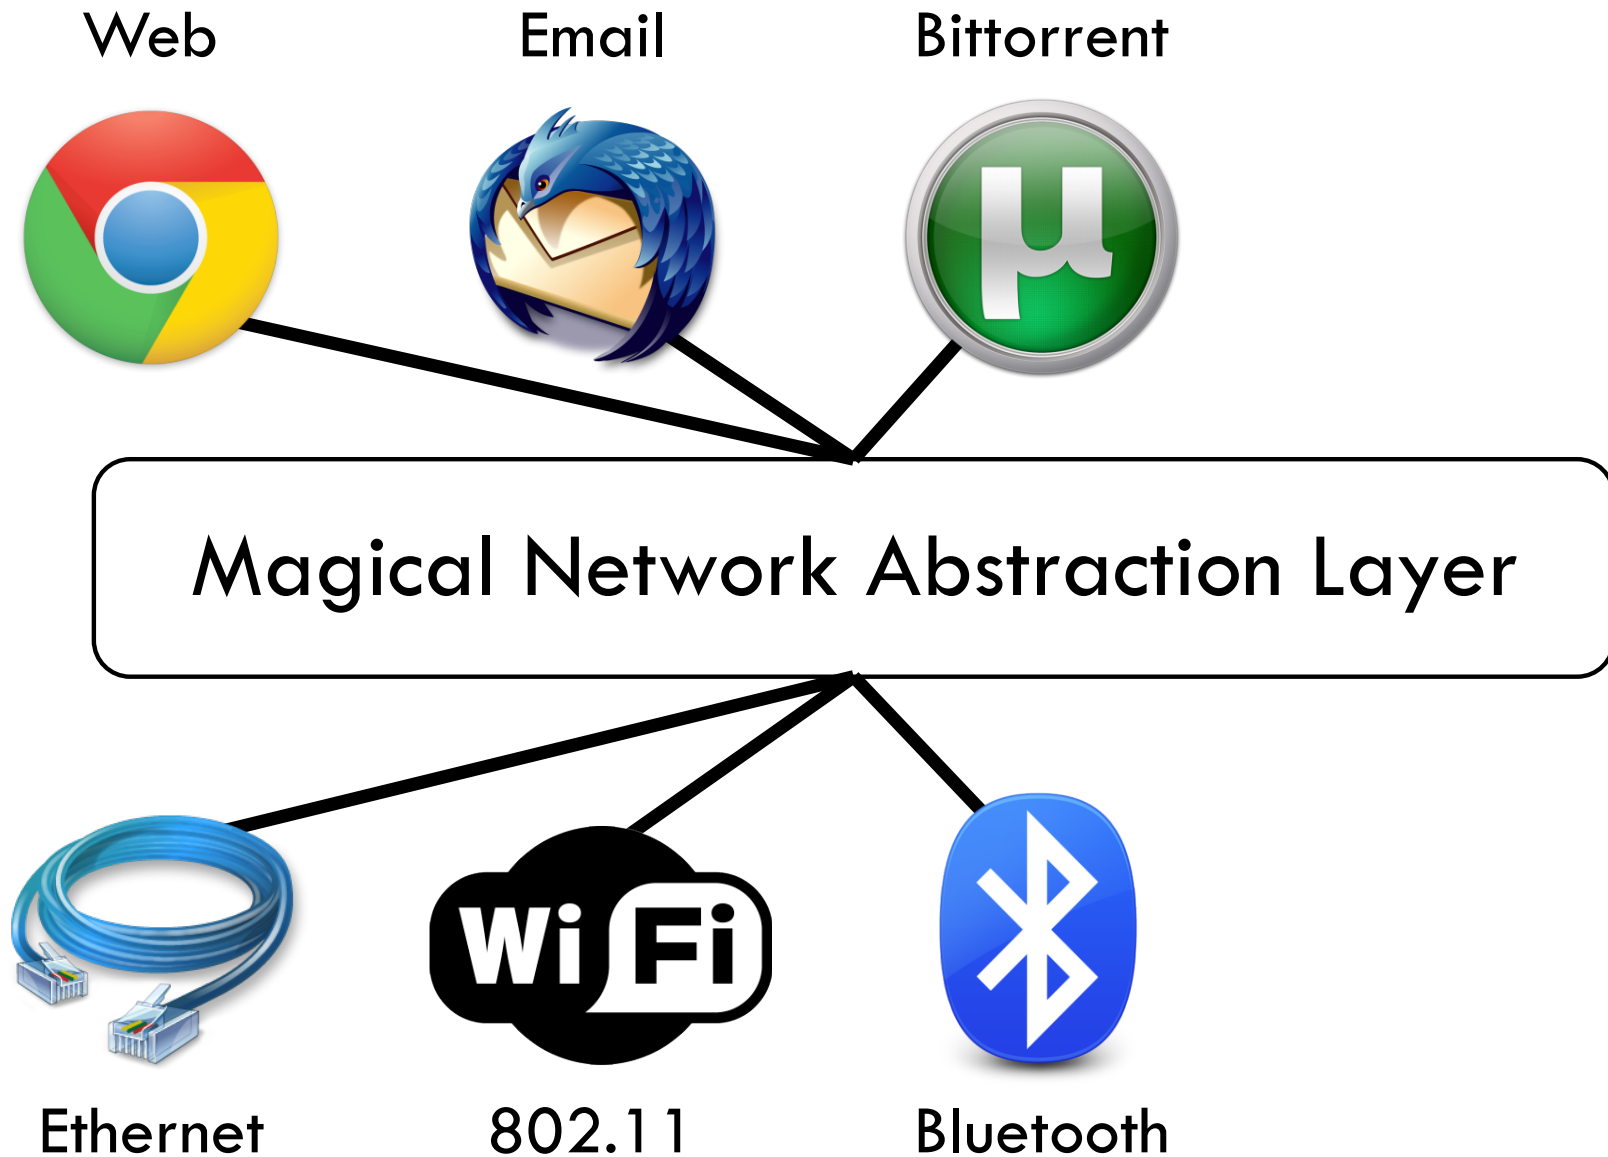

More Problems

8

Solution:

9

Solution: Use Indirection

10

Layered Network Stack

11

- Modularity
 - ▣ Does not specify an implementation
 - ▣ Instead, tells us how to organize functionality
- Encapsulation
 - ▣ Interfaces define cross-layer interaction
 - ▣ Layers only rely on those below them
- Flexibility
 - ▣ Reuse of code across the network
 - ▣ Module implementations may change
- Unfortunately, there are tradeoffs
 - ▣ Interfaces hide information
 - ▣ As we will see, may hurt performance...

Key Questions

12

- How do we divide functionality into layers?
 - ▣ Routing
 - ▣ Congestion control
 - ▣ Error checking
 - ▣ Security
 - ▣ Fairness
 - ▣ And many more...
- How do we distribute functionality across devices?
 - ▣ Example: who is responsible for sanity check?

13 Outline

□ Layering

- The OSI Model

□ Communicating

- The End-to-End Argument

The ISO OSI Model

14

OSI: Open Systems Interconnect Model

Host 1

Router

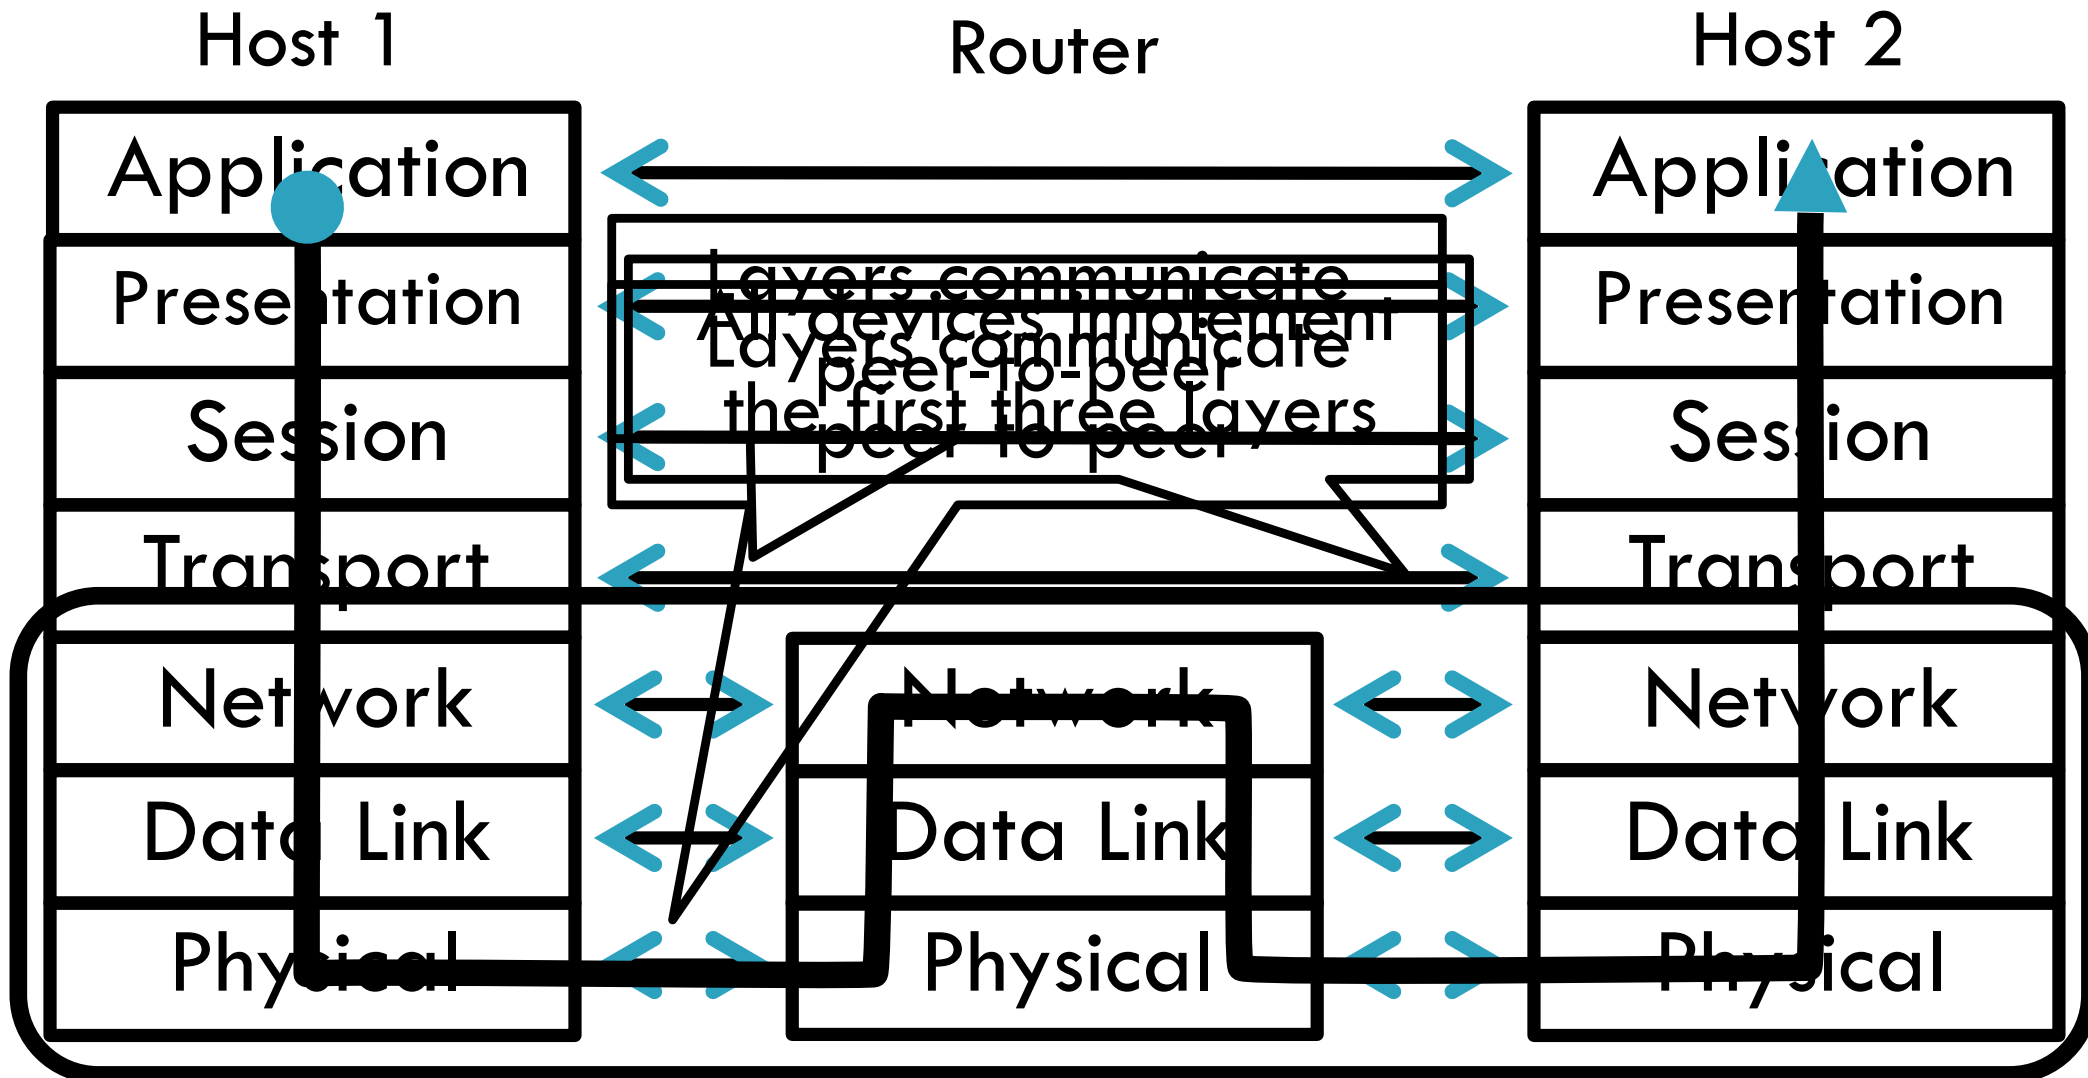

Host 2

The ISO OSI Model

15

OSI: Open Systems Interconnect Model

Layer Features

16

- Service
 - ▣ What does this layer do?
- Interface
 - ▣ How do you access this layer?
- Protocol
 - ▣ How is this layer implemented?

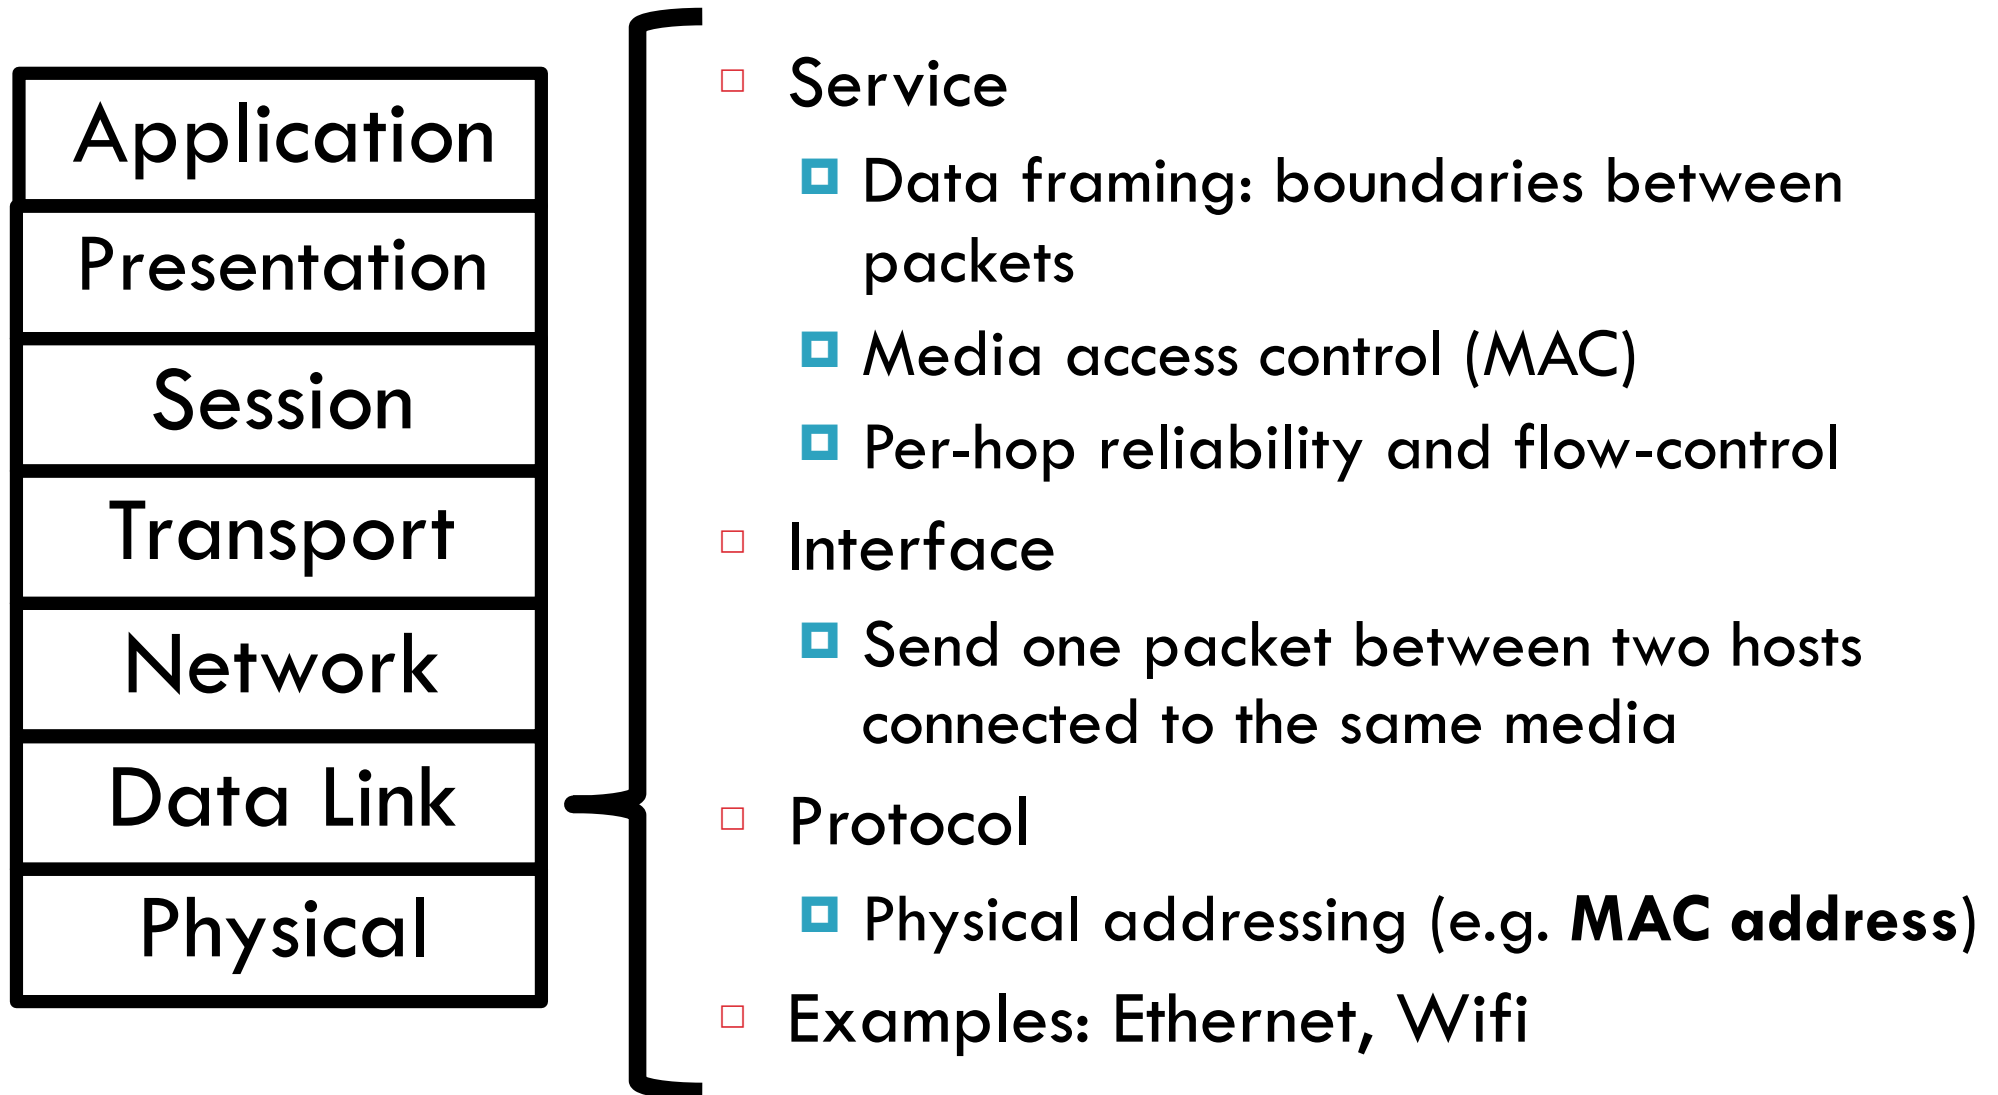

Physical Layer

17

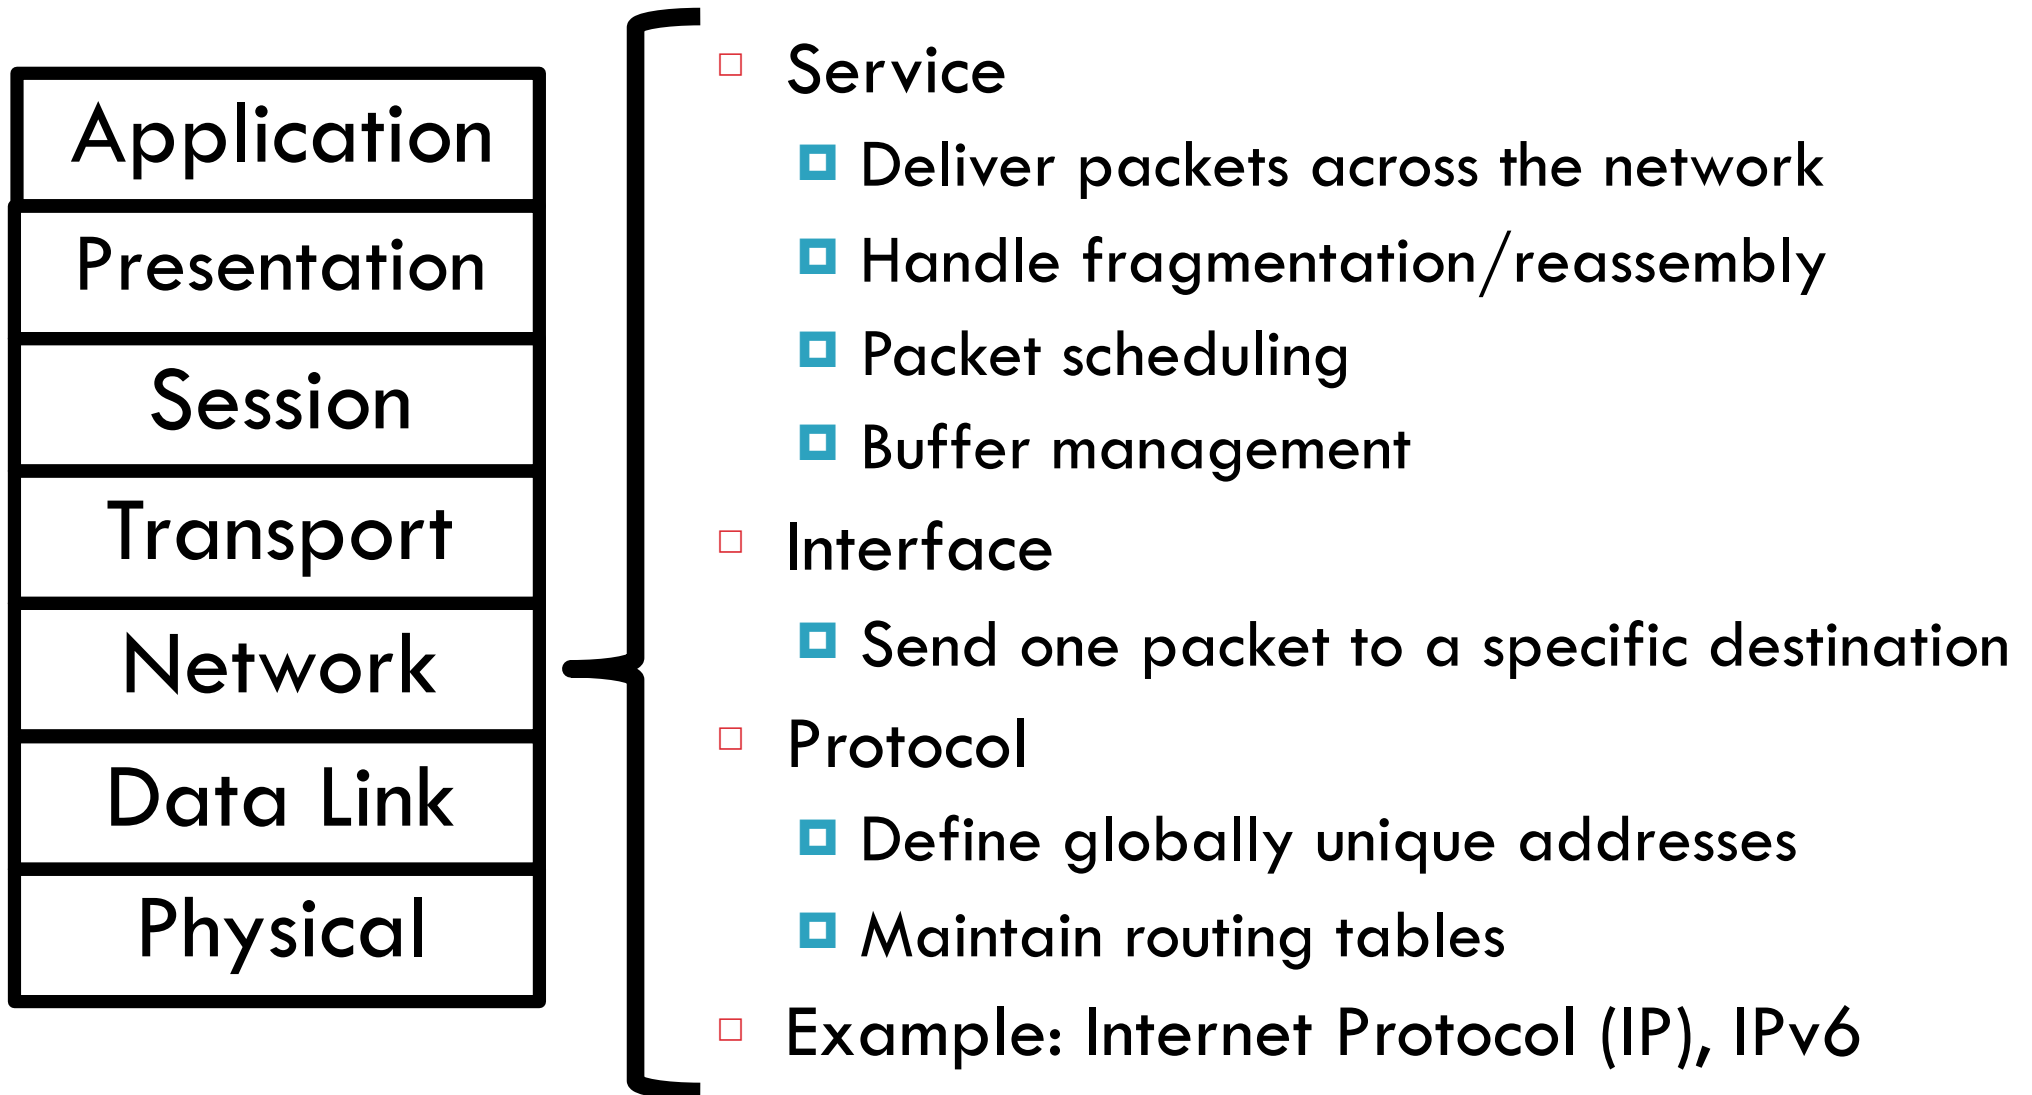

Data Link Layer

18

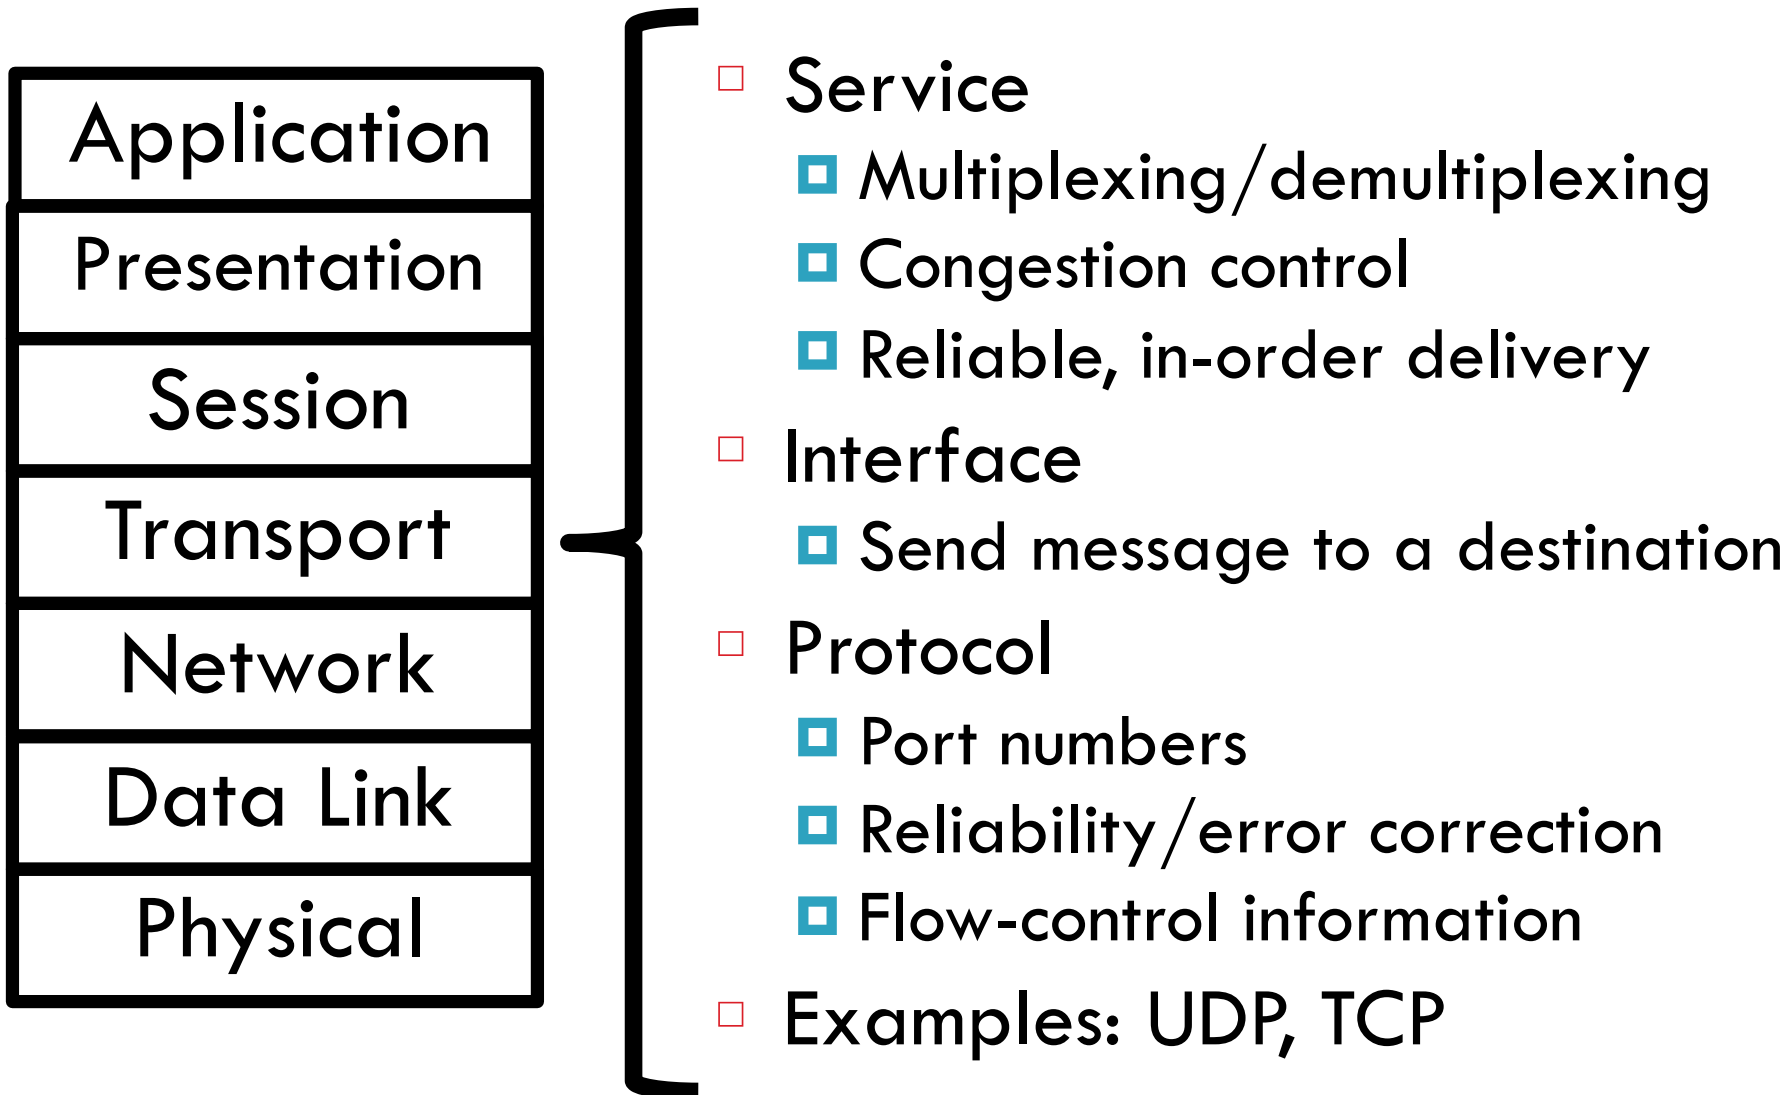

Network Layer

19

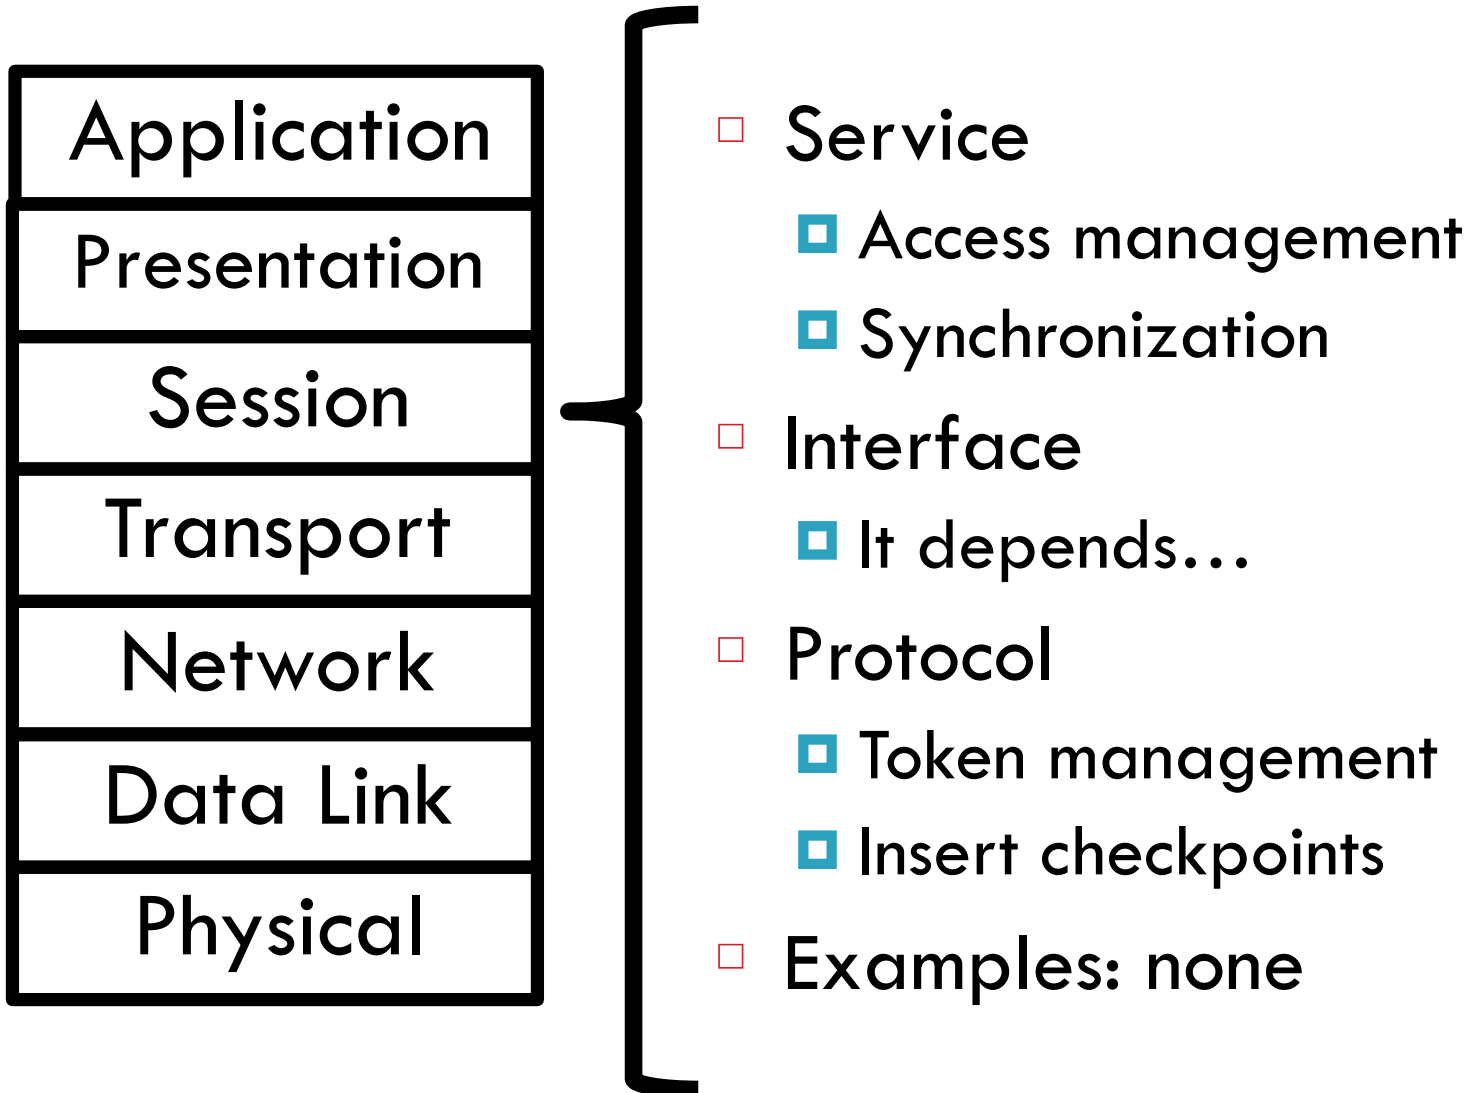

Transport Layer

20

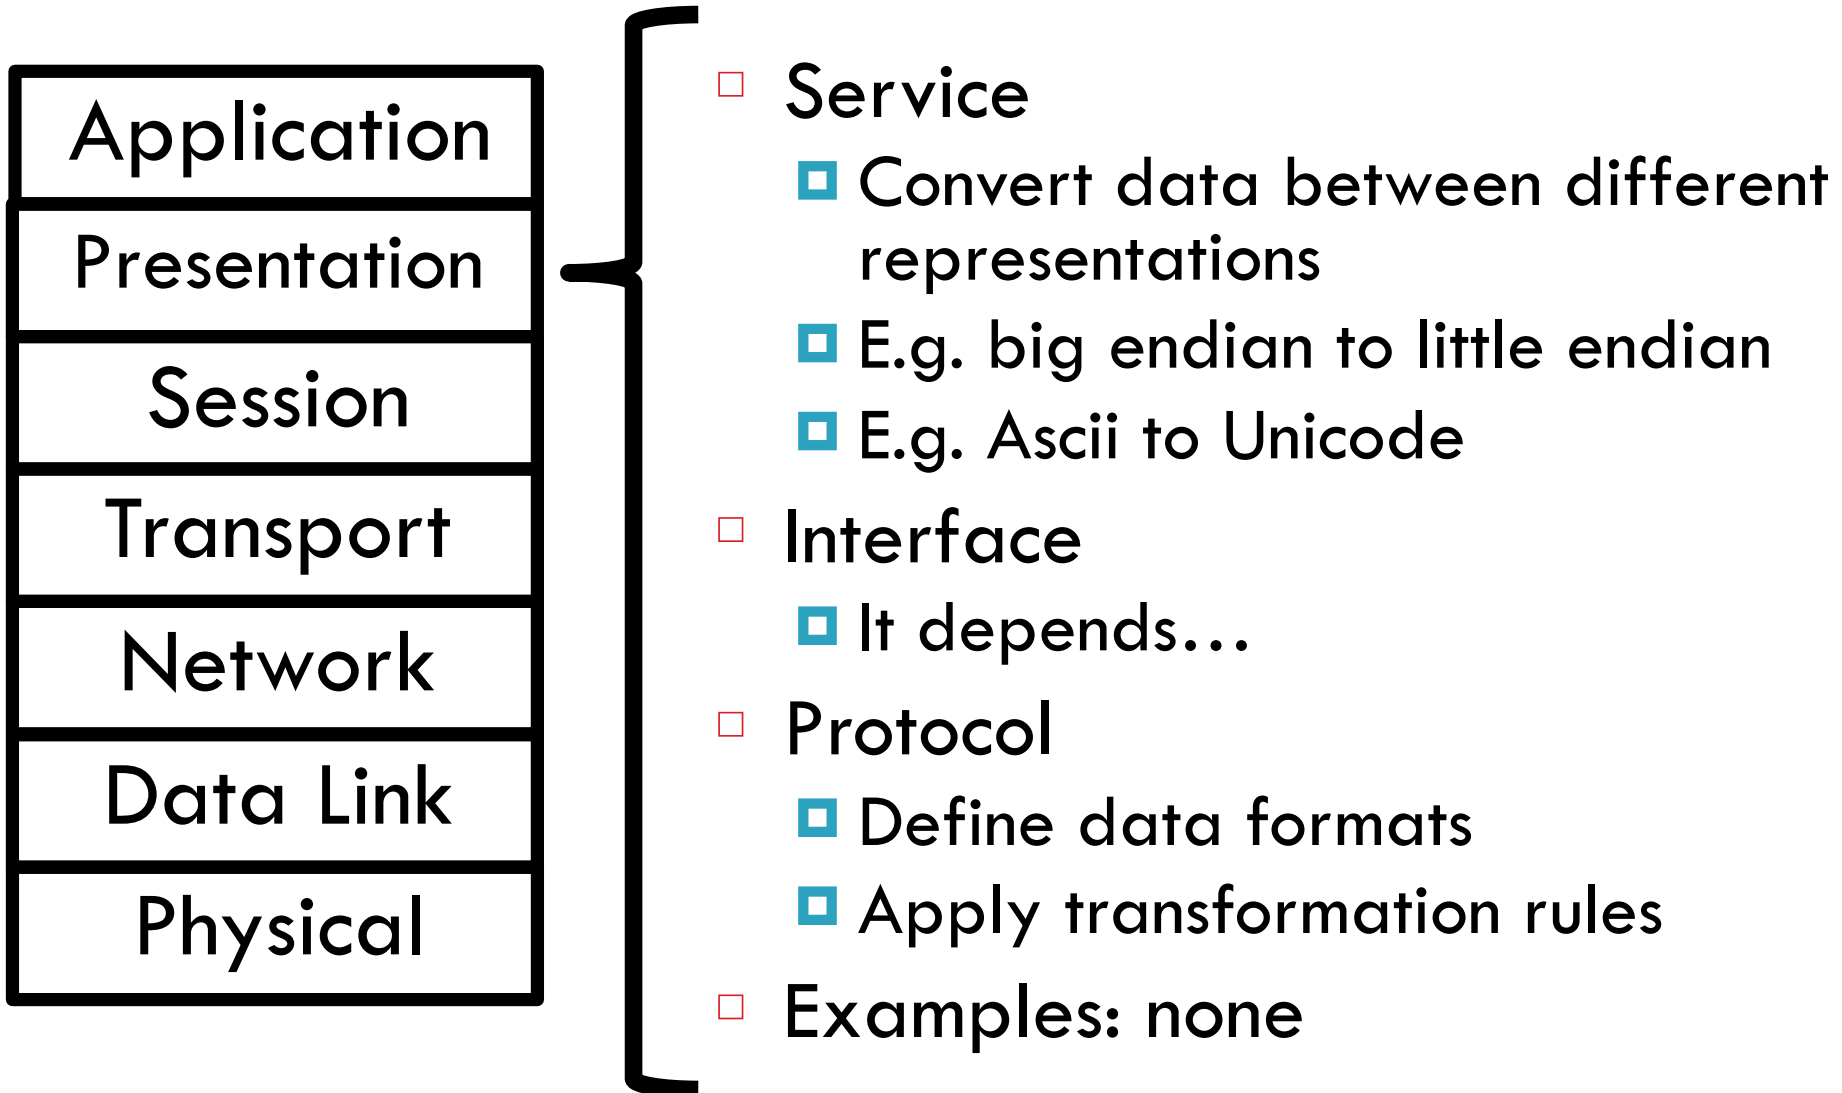

Session Layer

21

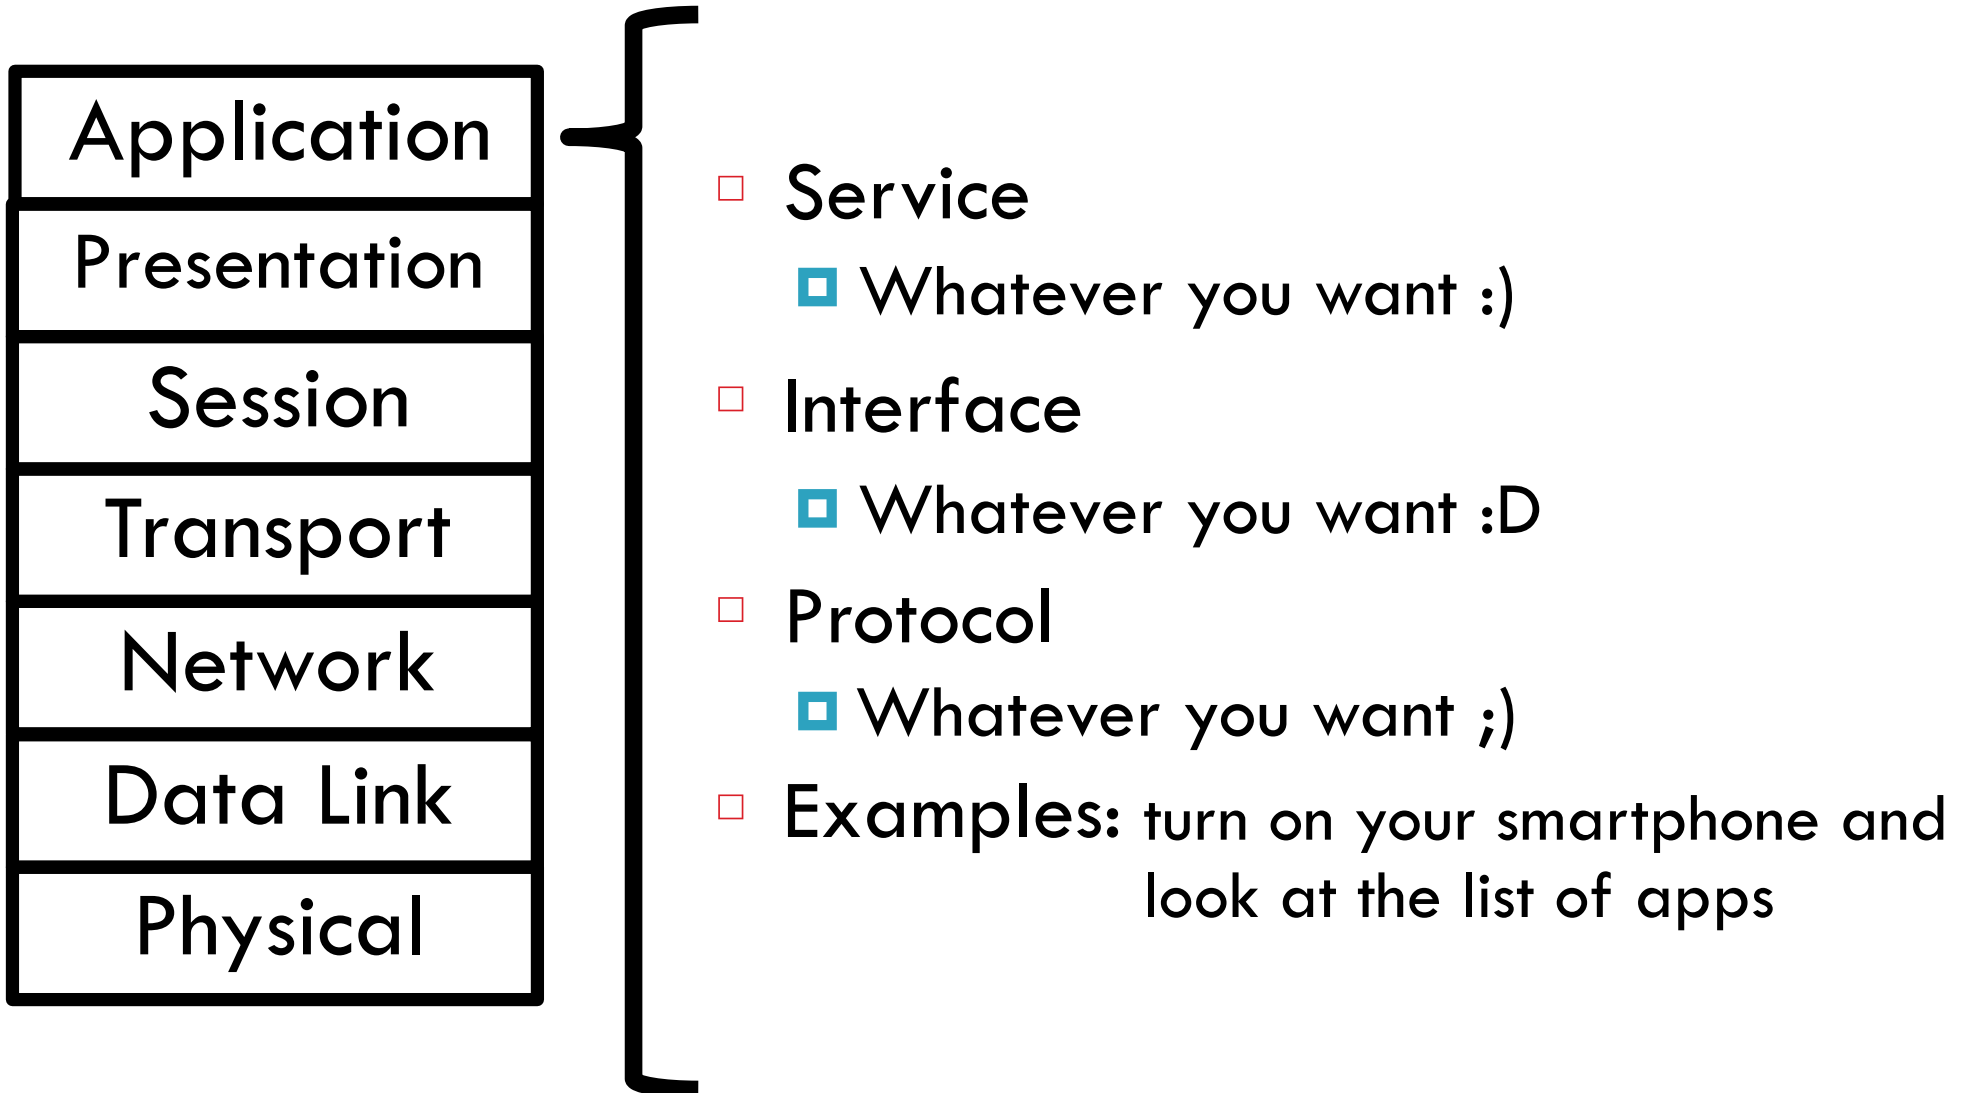

Presentation Layer

22

Application Layer

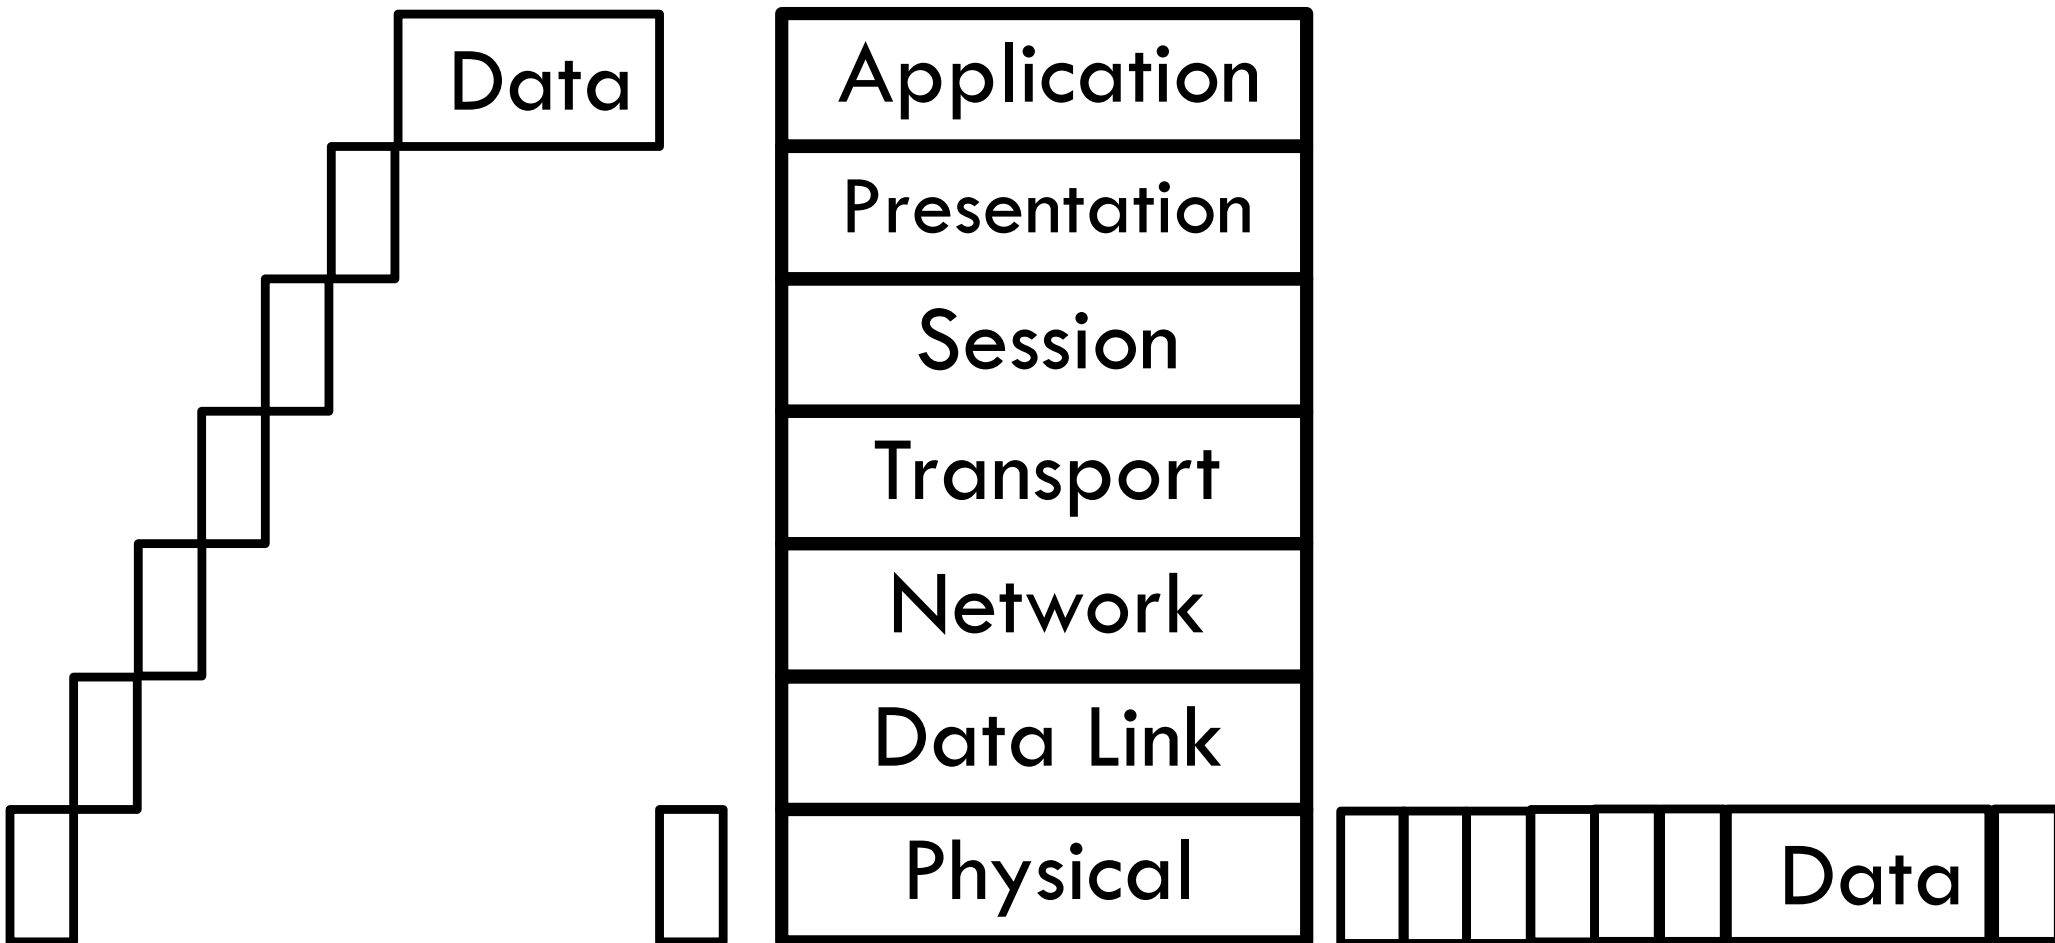

23

Encapsulation

24

How does data move through the layers?

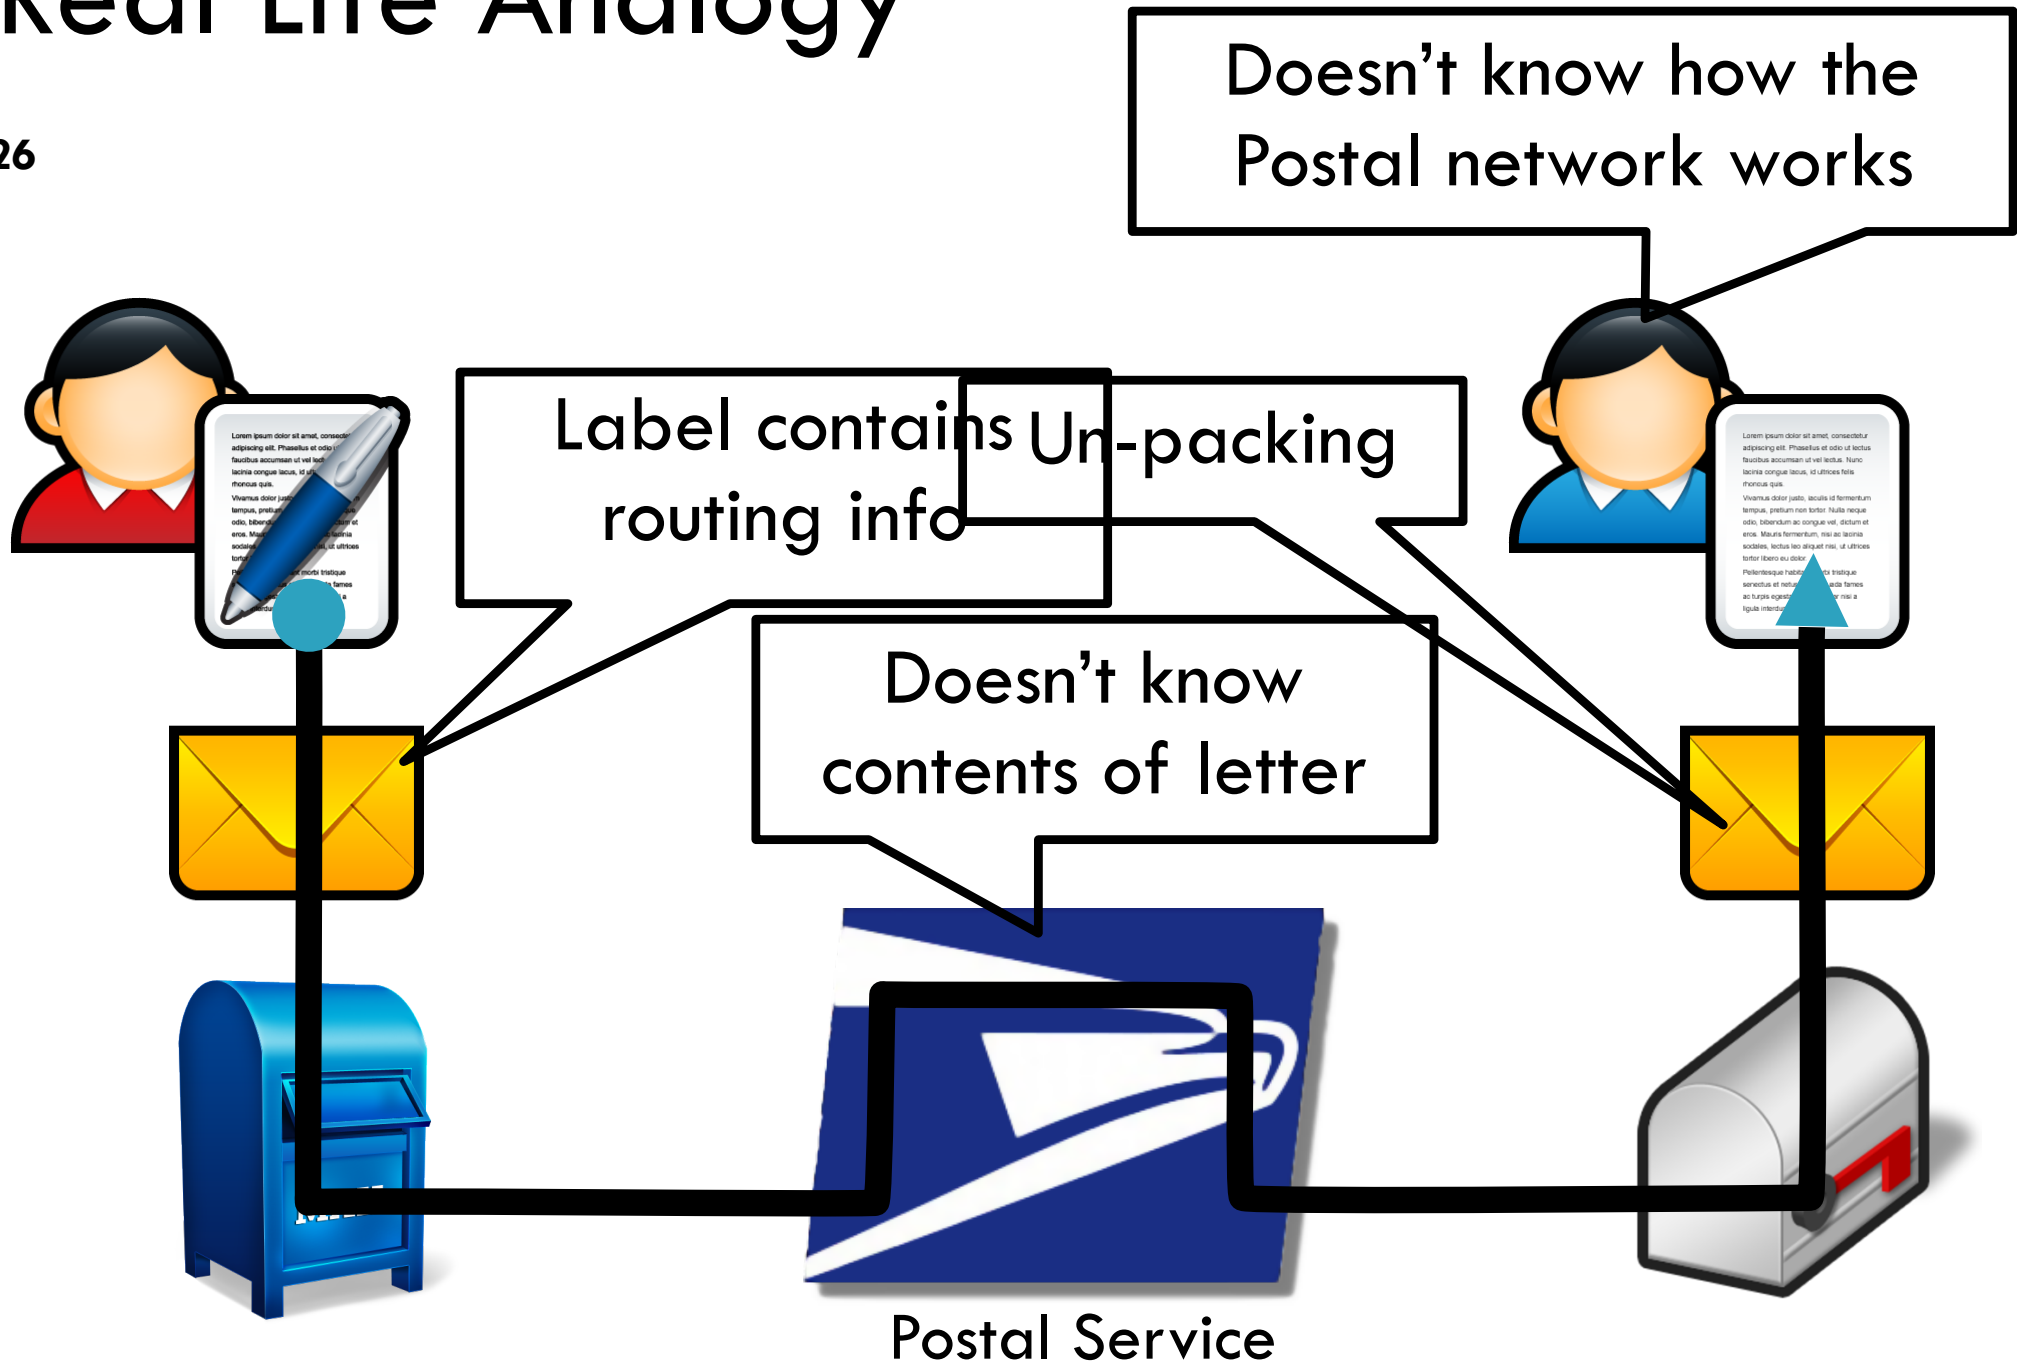

Real Life Analogy

25

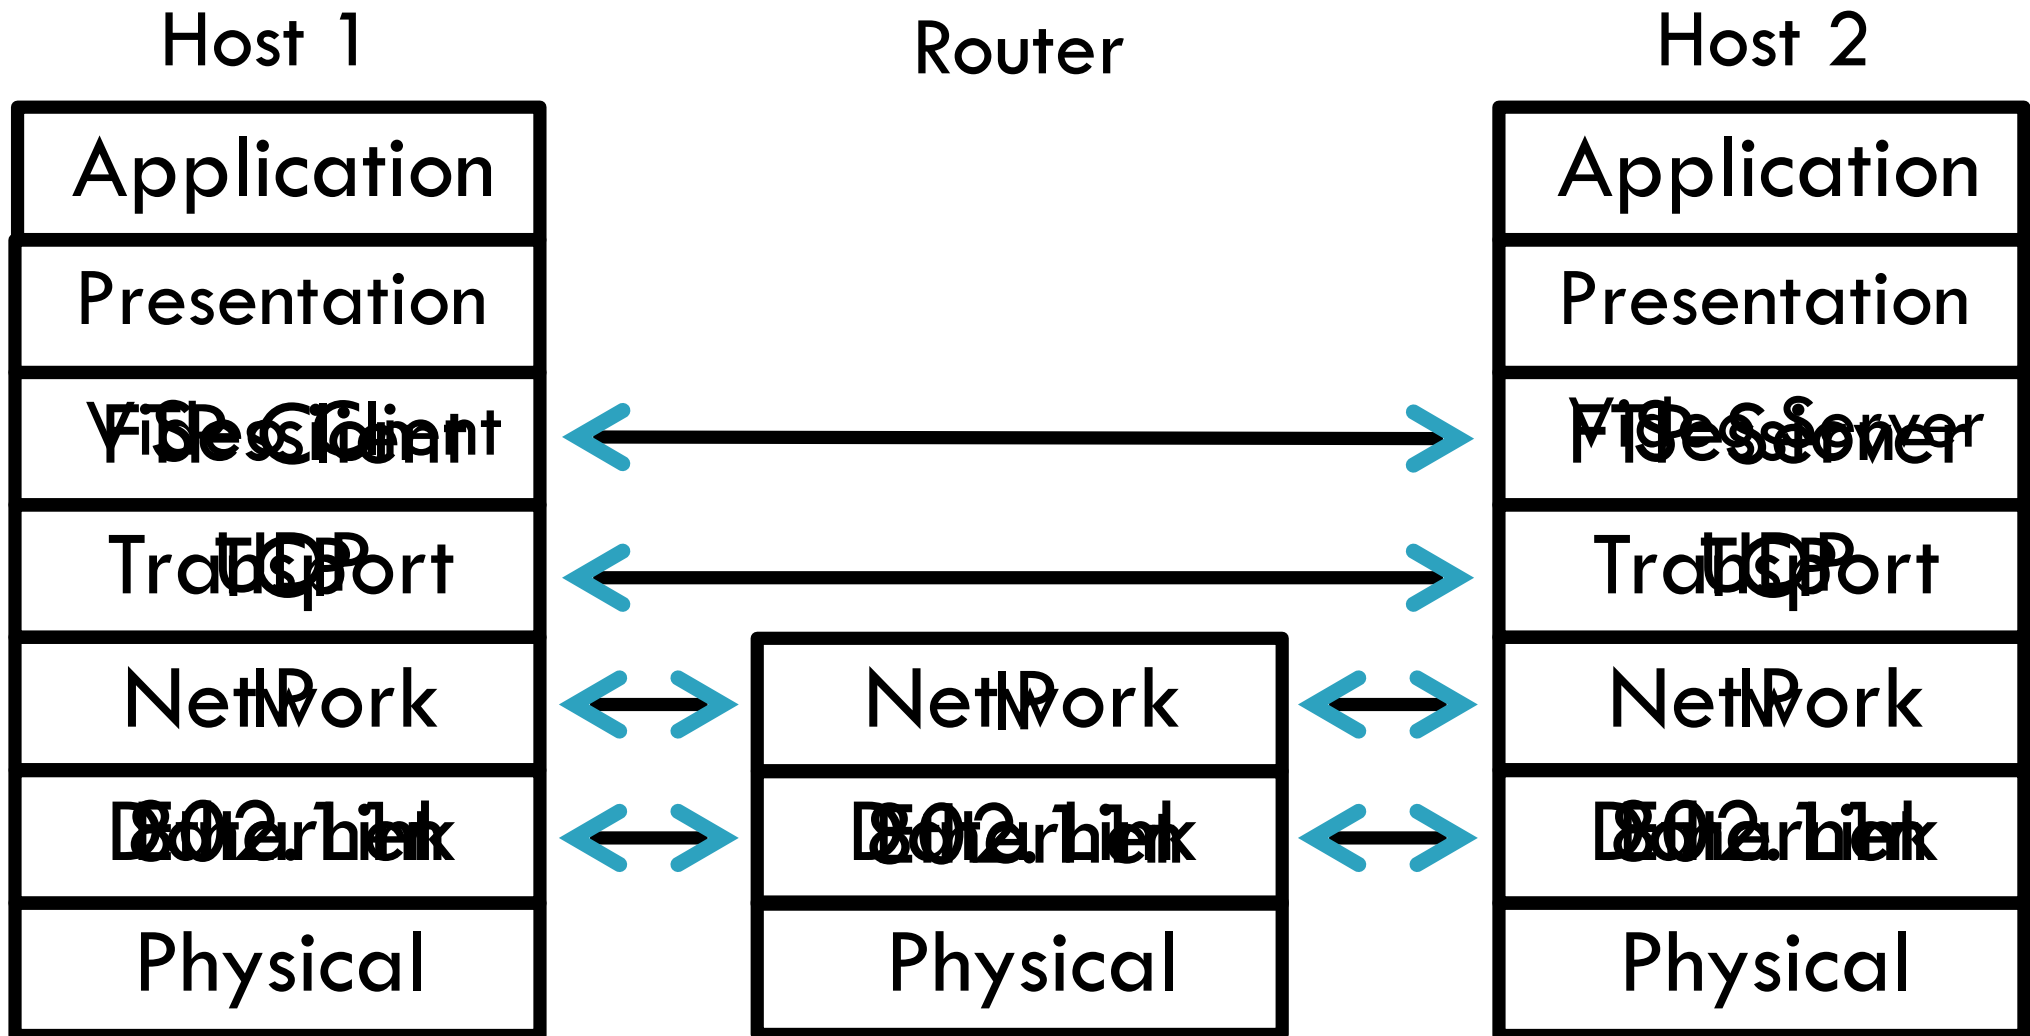

Real Life Analogy

26

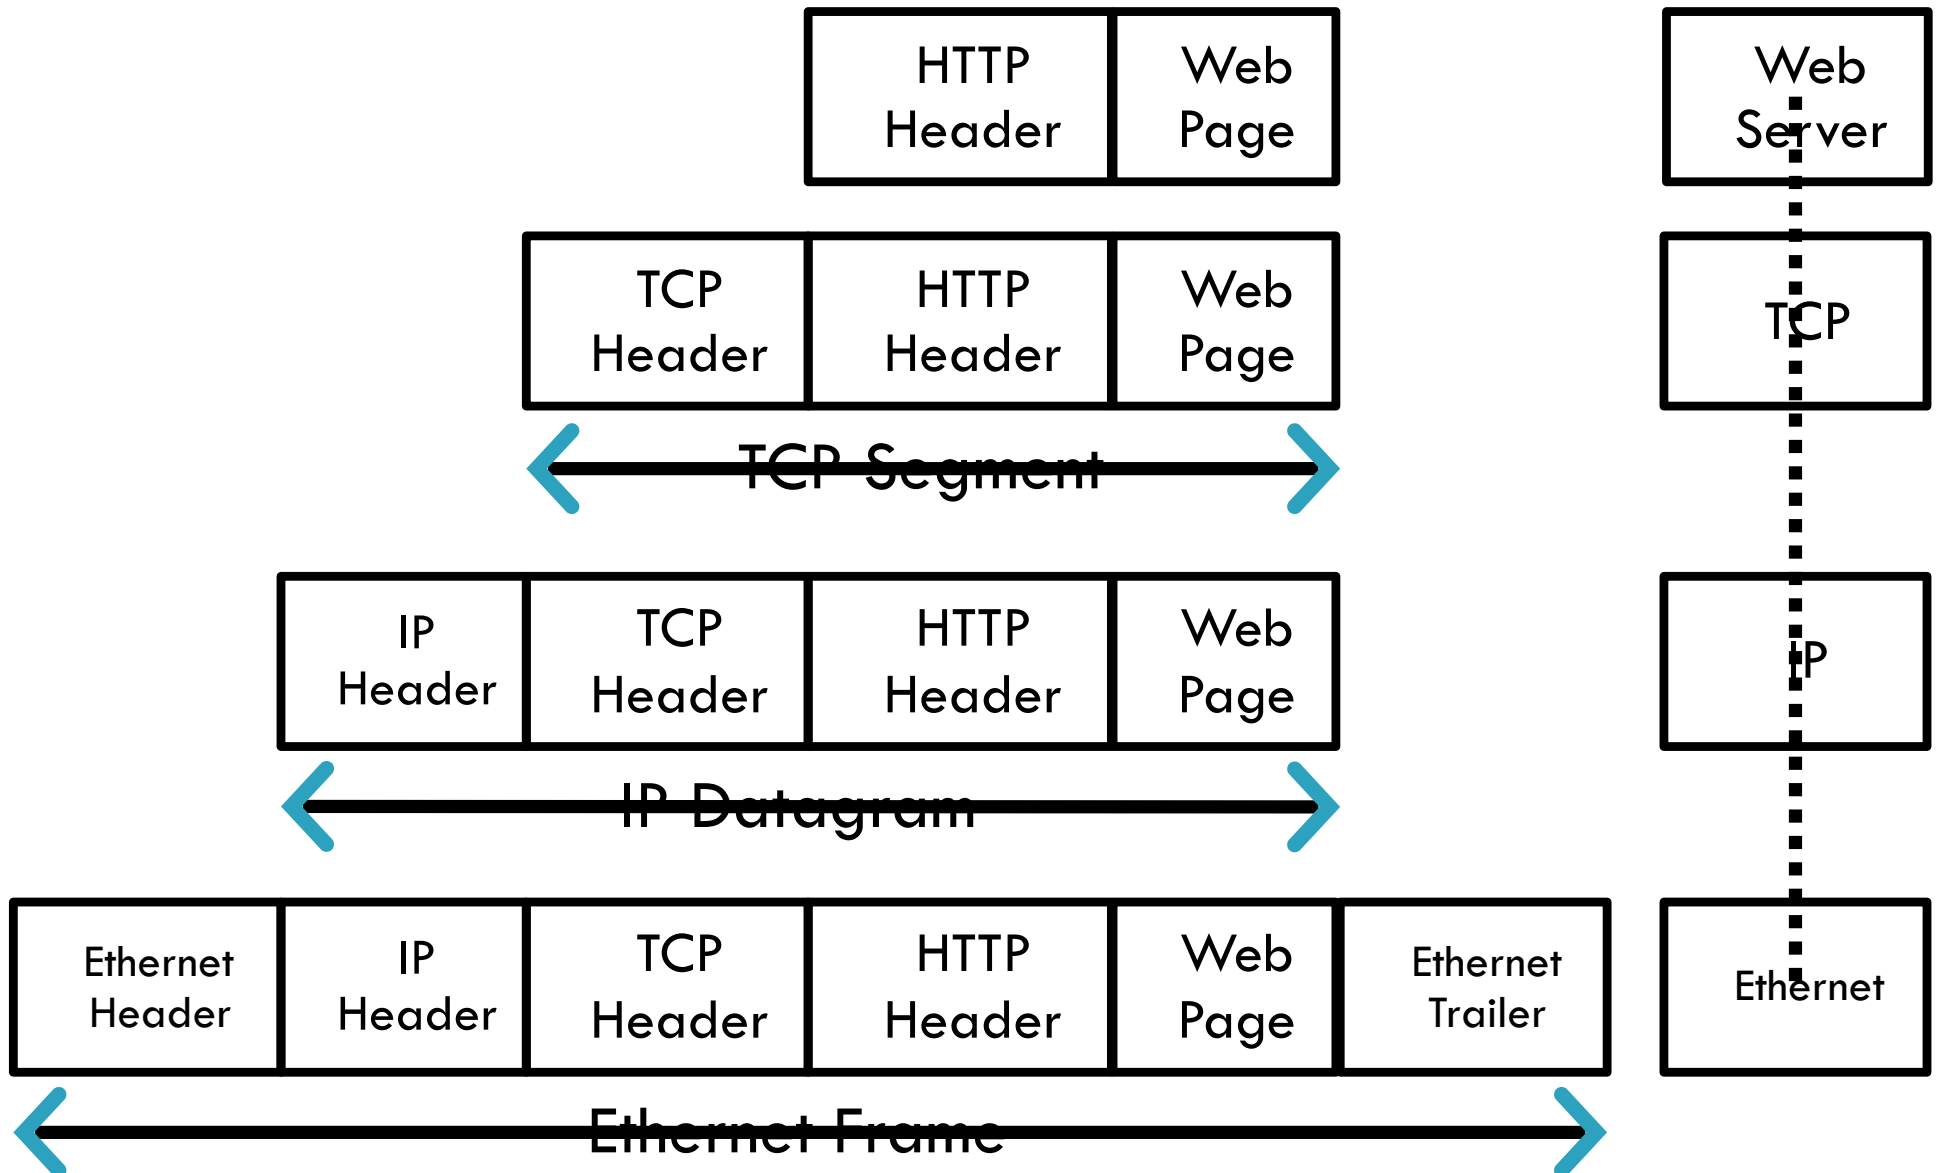

Network Stack in Practice

27

Encapsulation, Revisited

28

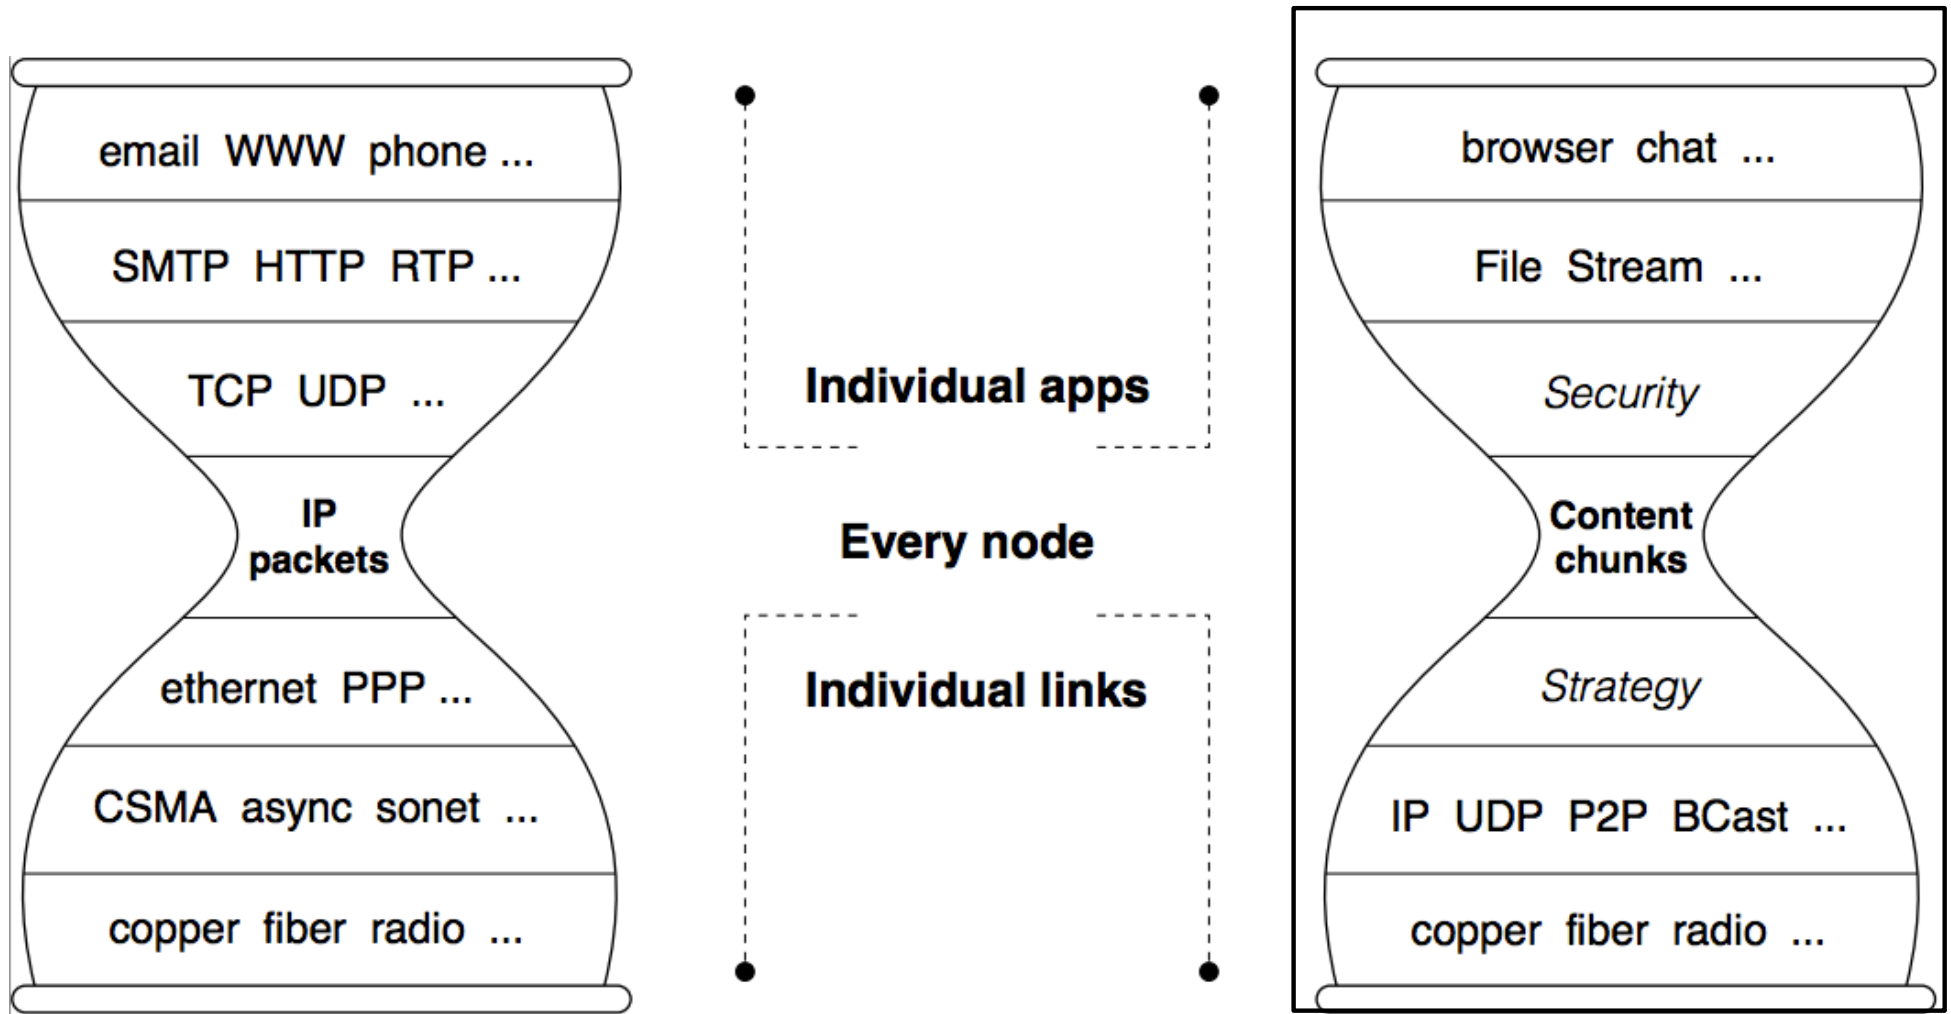

The Hourglass

29

An Example of the New Architectures Named Data Networking (NDN)

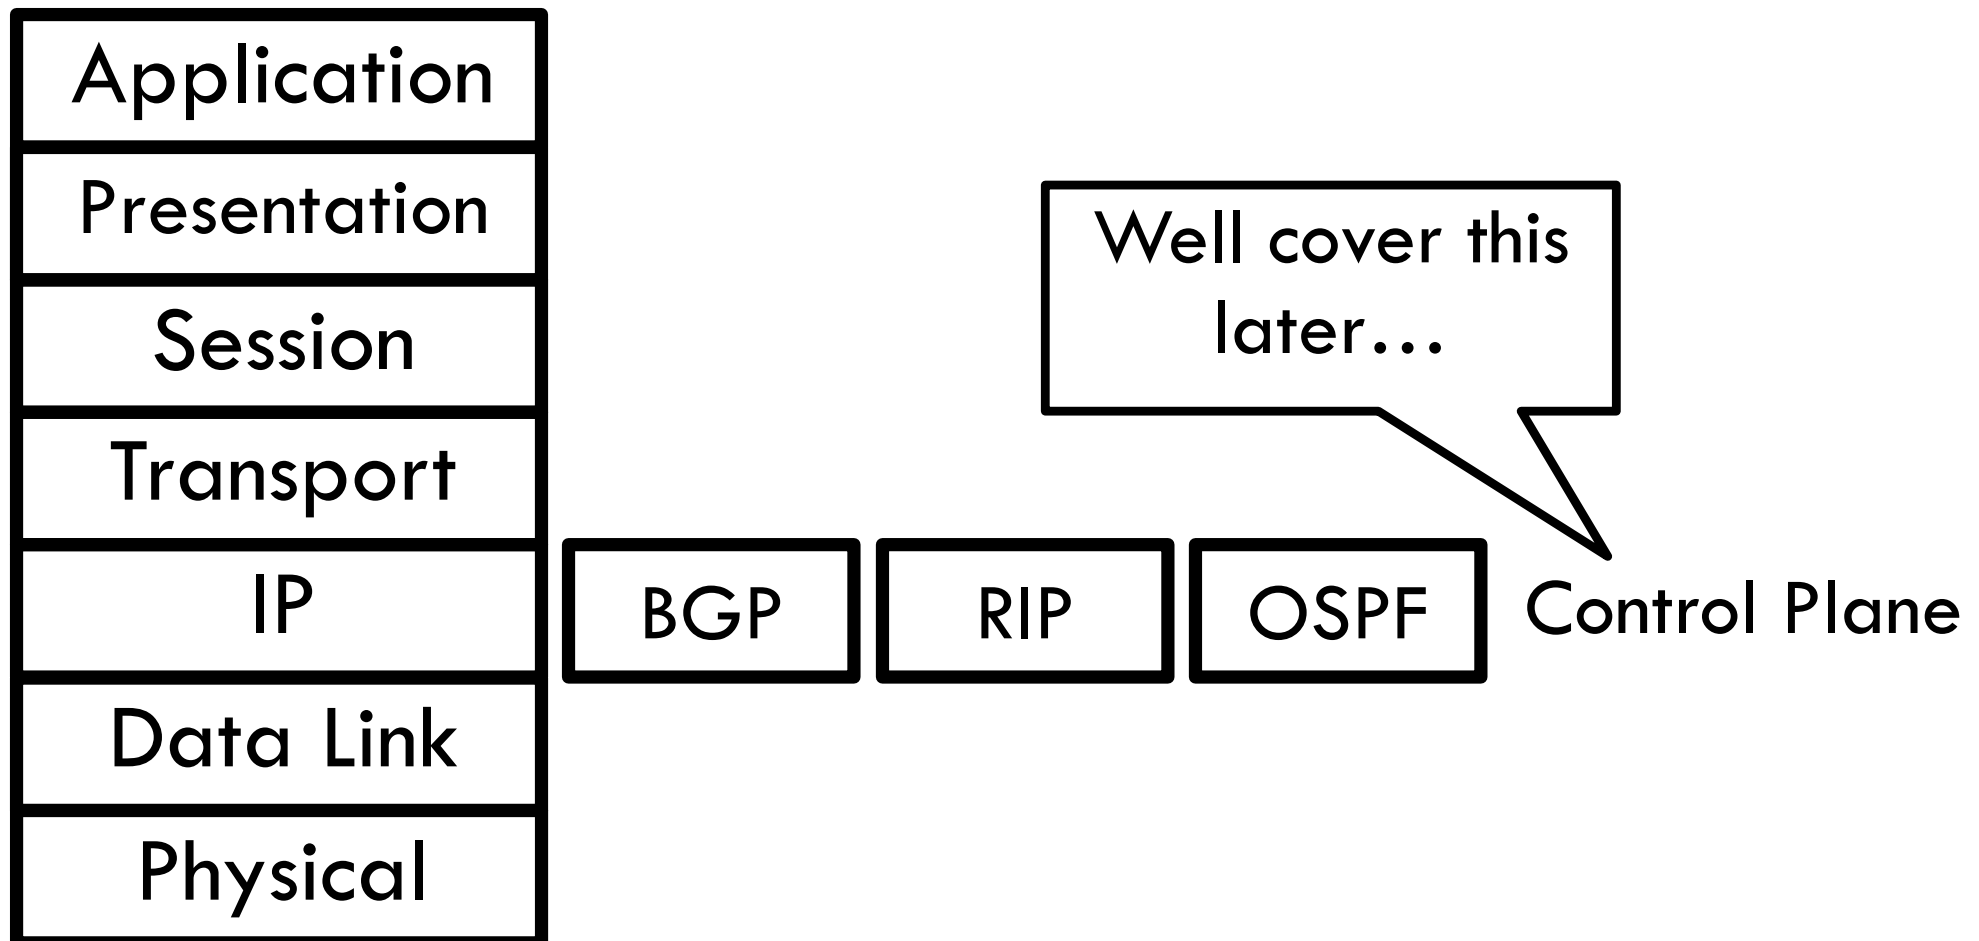

30

Orthogonal Planes

31

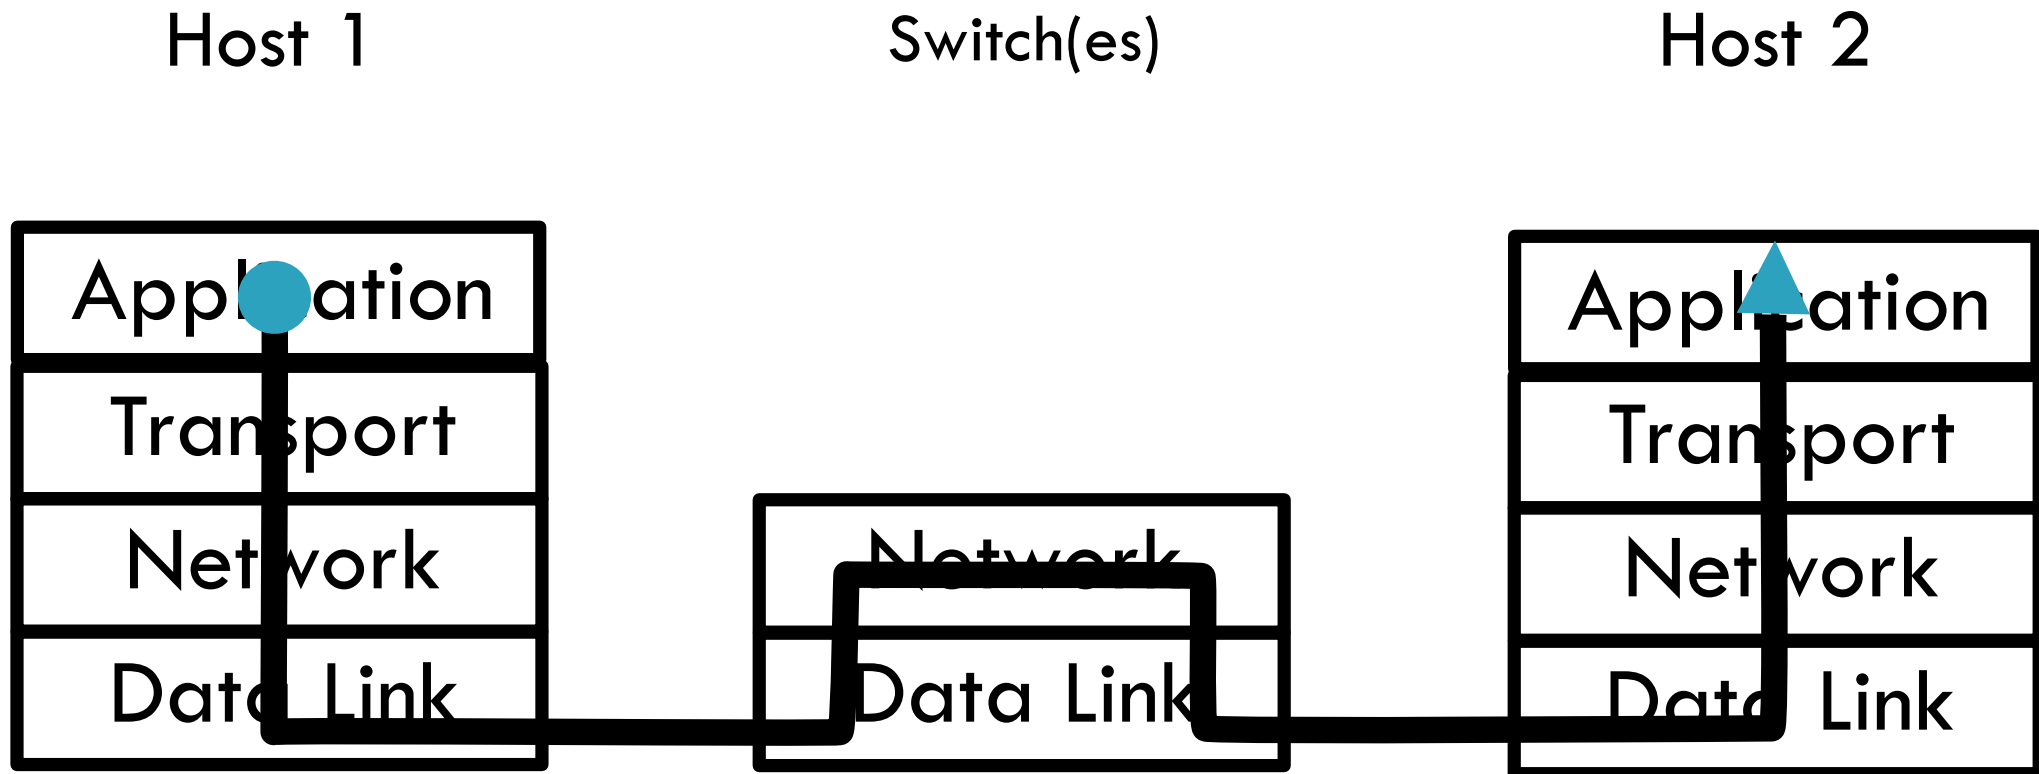

Control plane: How **Internet paths** are established

Orthogonal Planes

32

Data plane: How data is **forwarded** over Internet paths

Reality Check

33

- The layered abstraction is very nice
- Does it hold in reality?

No. (Any examples?)

Firewalls

- Analyze application layer headers

Transparent Proxies

- Simulate application endpoints within the network

NATs

- Break end-to-end network reachability

34 Outline

☐ Layering

- ☐ The OSI Model

☐ Communicating

- ☐ The End-to-End Argument

From Layers to Eating Cake

35

- IP gives us best-effort datagram forwarding
 - ▣ So simple anyone can do it
 - ▣ Large part of why the Internet has succeeded
 - ▣ ...but it sure isn't giving us much

- Layers give us a way to **compose** functionality
 - ▣ Example: HTTP over TCP for Web browsers with reliable connections

- ...but they do not tell us where (in the network) to implement the functionality

Where to Place Functionality

36

- How do we distribute functionality across devices?
 - ▣ Example: who is responsible for security?

- “The End-to-End Arguments in System Design”
 - ▣ Saltzer, Reed, and Clark
 - ▣ The Sacred Text of the Internet
 - ▣ Endlessly debated by researchers and engineers

Basic Observation

37

- Some applications have end-to-end requirements
 - ▣ Security, reliability, etc.
- Implementing this stuff inside the network is hard
 - ▣ Every step along the way must be fail-proof
 - ▣ Different applications have different needs
- End hosts...
 - ▣ Can't depend on the network
 - ▣ Can satisfy these requirements without network level support

Example: Reliable File Transfer

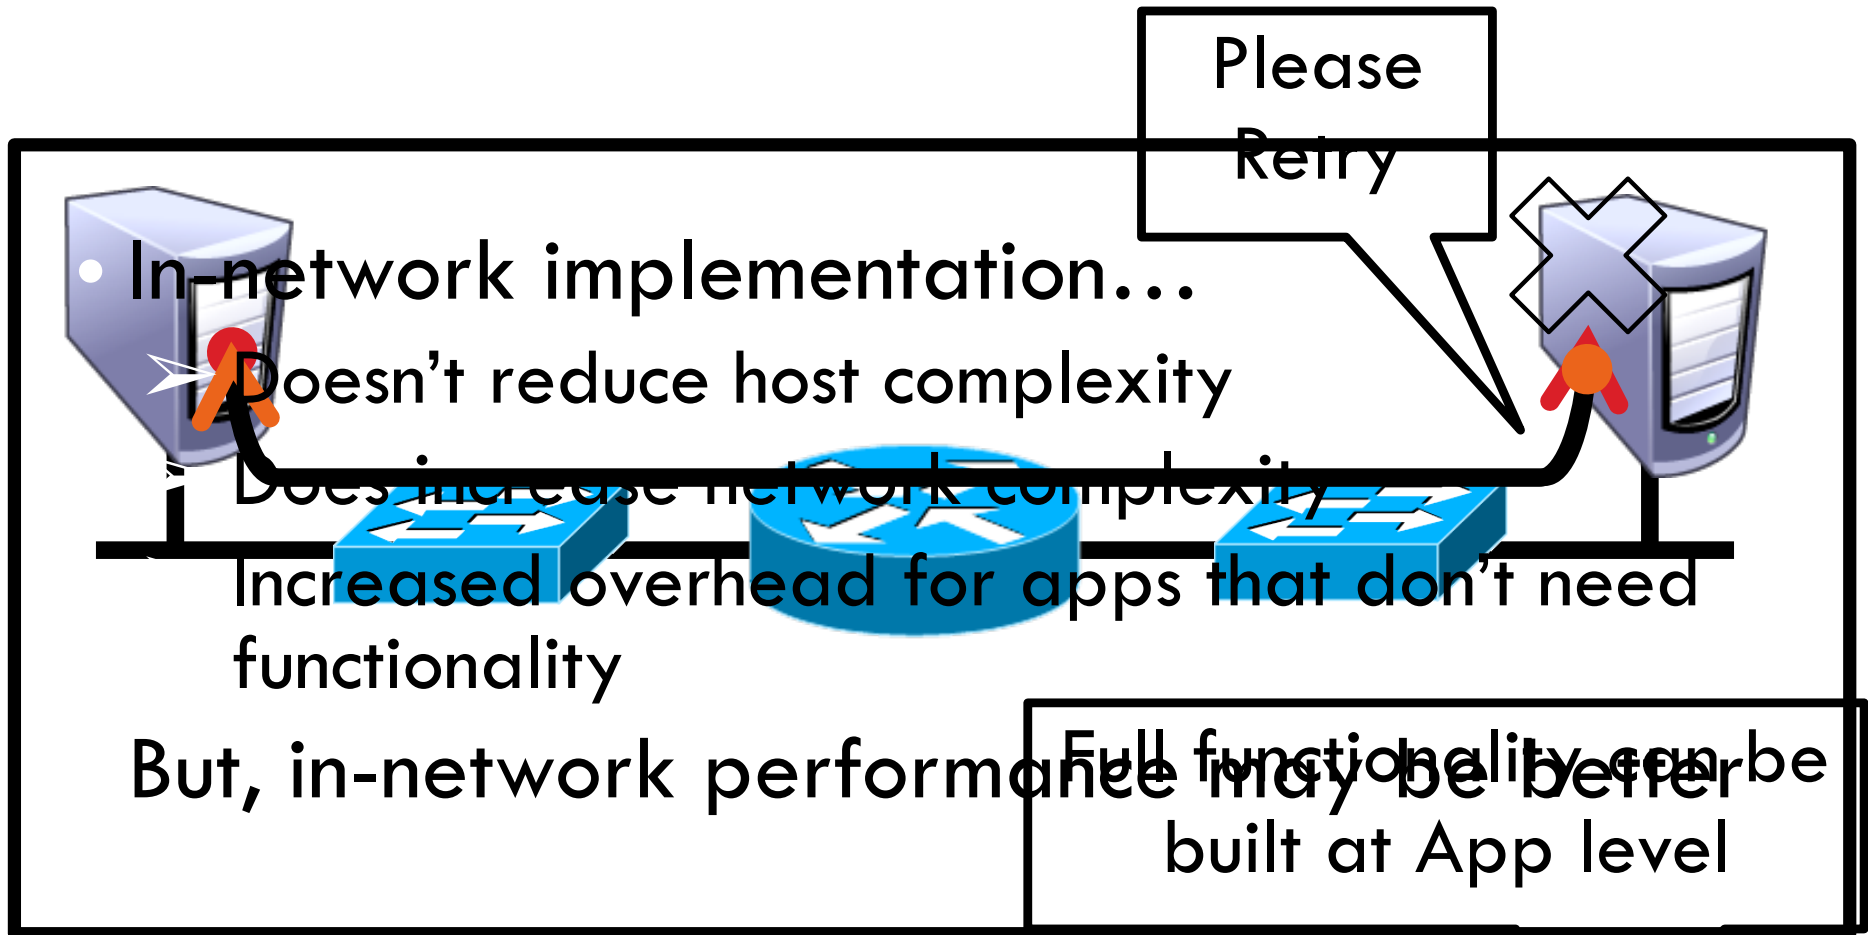

38

- ❑ ~~Solution 1: Make the network reliable~~
- ❑ Solution 2: App level, end-to-end check, retry on failure

Example: Reliable File Transfer

39

- ❑ ~~Solution 1: Make the network reliable~~
- ❑ Solution 2: App level, end-to-end check, retry on failure

Conservative Interpretation

40

“Don’t implement a function at the lower levels of the system unless it can be completely implemented at this level” (Peterson and Davie)

Basically, unless you can completely remove the burden from end hosts, don’t bother

Radical Interpretation

41

- Don't implement anything in the network that can be implemented correctly by the hosts
- Make network layer absolutely minimal
- Ignore performance issues

Moderate Interpretation

42

- Think twice before implementing functionality in the network
- If hosts can implement functionality correctly, implement it a lower layer only as a performance enhancement
- But do so only if it does not impose burden on applications that do not require that functionality...
- ...and if it doesn't cost too much \$ to implement

Reality Check, Again

43

- Layering and E2E principals regularly violated

Firewalls

Transparent Proxies

NATs

- Conflicting interests
 - ▣ Architectural purity
 - ▣ Commercial necessity

Message [1](#) of 9 (7,044 Views)

For the past 14+ months as a Verizon triple play customer if I mistyped a URL into the addy bar of my Firefox browser (I take IE off my system and will not use it), I would end up on the Google search site as a helpful place. I only use Google for

How-To Videos

Takeaways

47

- Layering for network functions
 - ▣ Helps manage diversity in computer networks
 - ▣ Not optimal for everything, but simple and flexible
- Narrow waist ensures interoperability, enables innovation
- E2E argument (attempts) to keep IP layer simple
- Think carefully when adding functionality into the network
