

# Comments about the quiz?

1

- No limit of challenges;
  - But you need to bring a document
  - Still need to come to office hours with the following in writing:
    - Specify the problem(s) you want regraded
    - For each problem, explain why the grade is in error

# CSCI-351

## DATA COMMUNICATION AND NETWORKS

### **Lecture 12: DNS** and your Project2

# Why Skipping Transport Layer?

3

- No; we will cover at the next class
- Project 2 is announced: DNS

# Project 2

4

**Data Communication and Networks**  
**CSCI-351 Fall 2018**

**Project 2: Simple DNS Client**  
**October 2, 2018**

*This project is due at 11:59:59pm on October 18, 2018 and is worth 20% of your grade. You must complete it with a partner. You may only complete it alone or in a group of three if you have the instructor's explicit permission to do so for this project.*

*Note that there is a milestone deadline for this project, at 11:59:59pm on October 11, 2018. More details are in the Milestone section below.*

## 1 Description

The Domain Name System (DNS) is a hierarchical system for converting domain names (e.g., `www.google.com`) to Internet Protocol (IP) addresses (e.g., `209.85.129.99`). DNS is often referred to as a “phone book” for the Internet, translating human-friendly domain names into machine-friendly IP addresses. In this project, you will implement a DNS client program, which handles DNS requests by querying other machines. Note that the graduate version of this project has additional requirements, which serve as an opportunity for extra credit for students enrolled in the undergraduate version of this course.

# Project 2

5

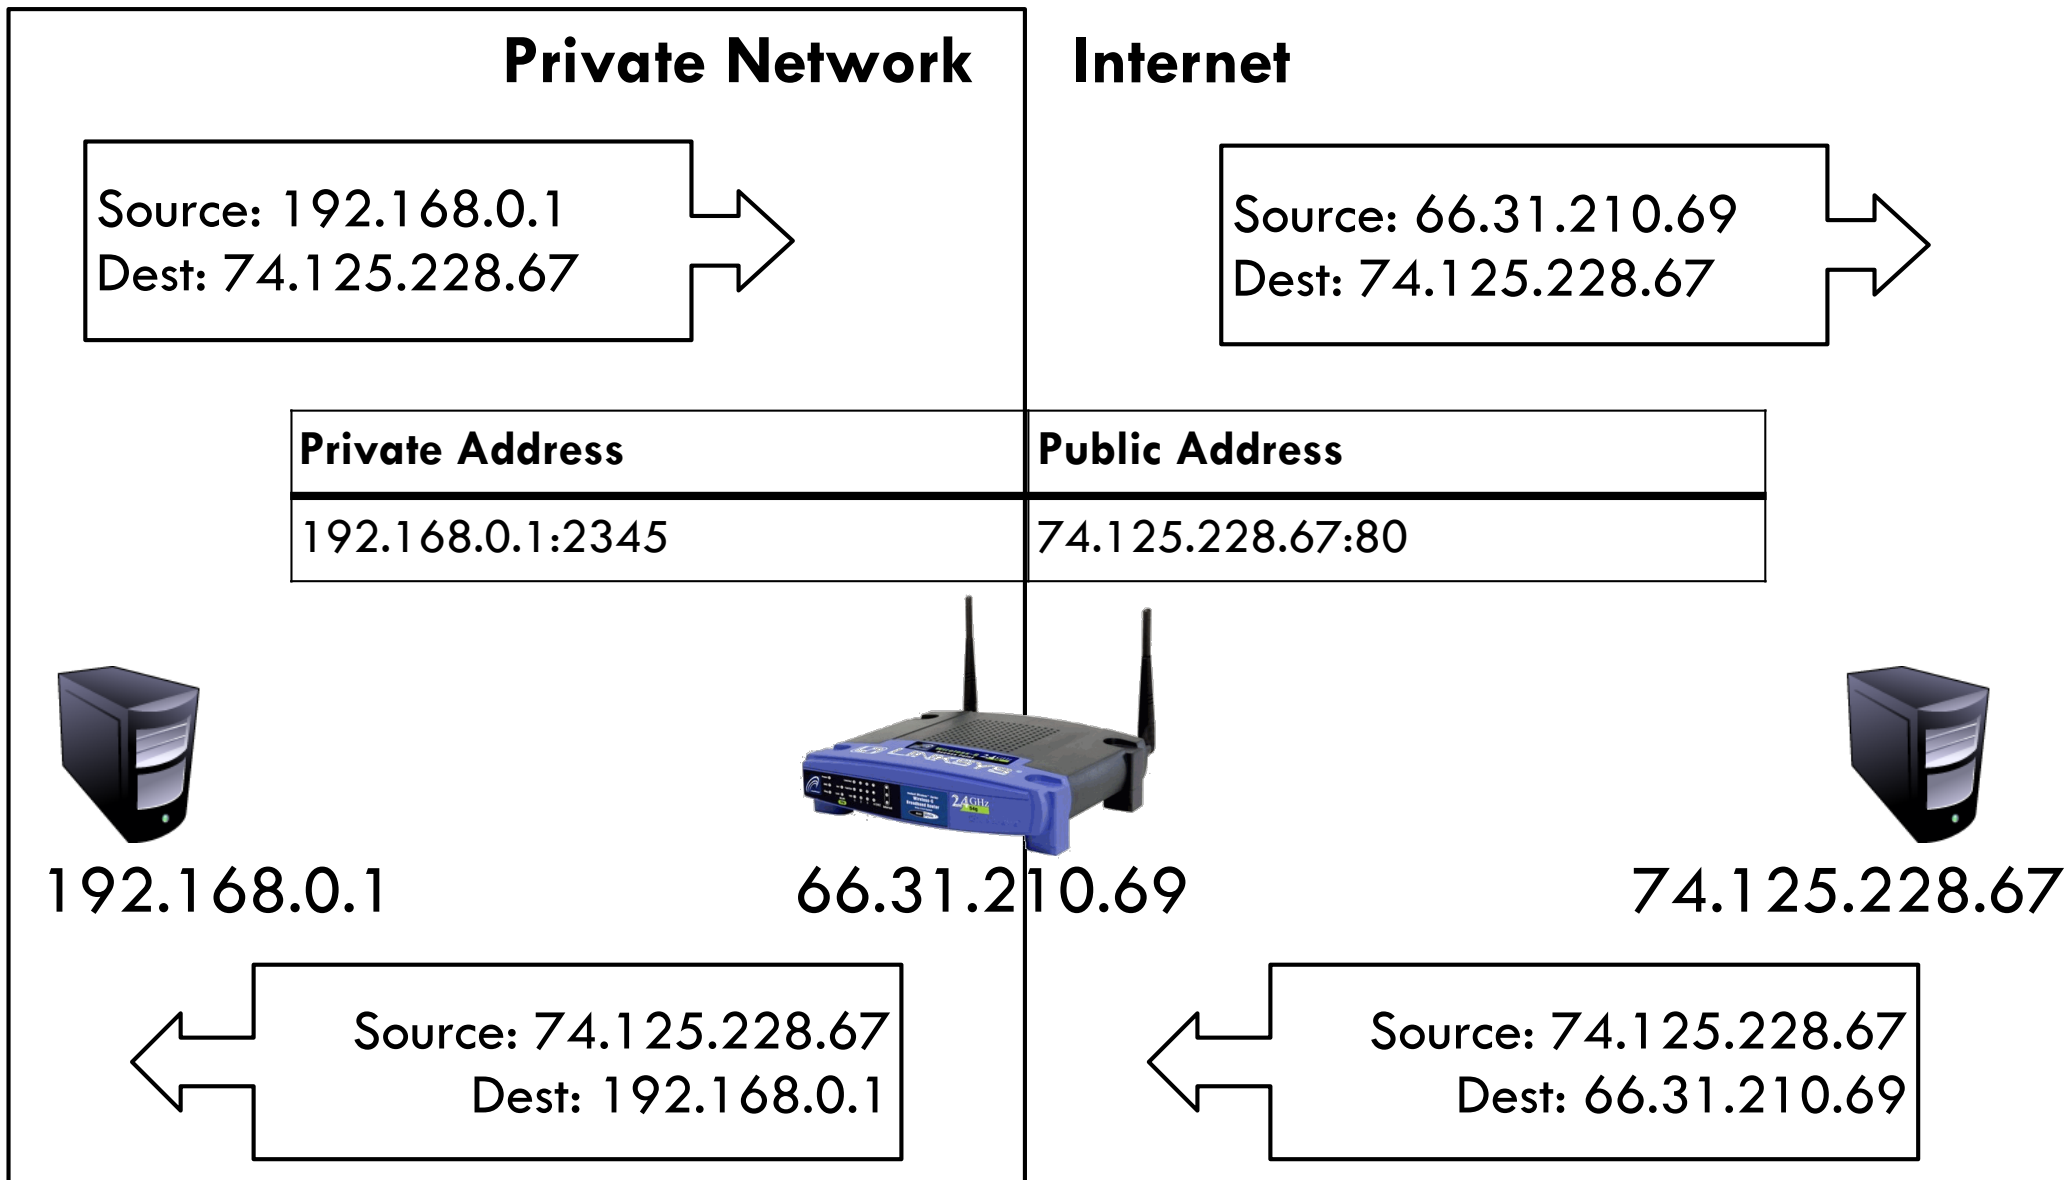

# The IPv4 Shortage

6

- Problem: consumer ISPs typically only give one IP address per-household
  - ▣ Additional IPs cost extra
  - ▣ More IPs may not be available
- NAT and DHCP
  - NAT + DHCP

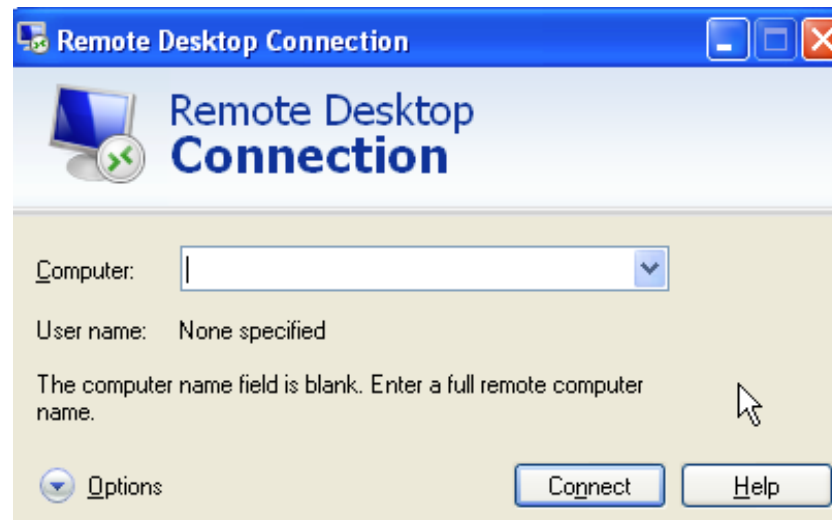

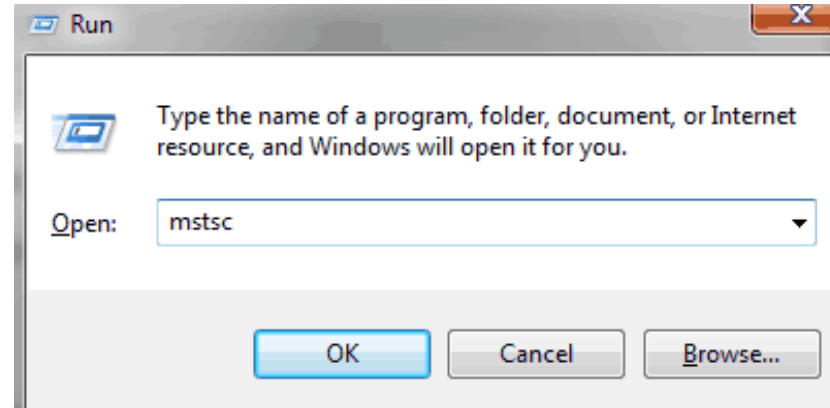

# Basic NAT Operation

7

# Port-forwarding

8

# DHCP: Dynamic Host Configuration Protocol

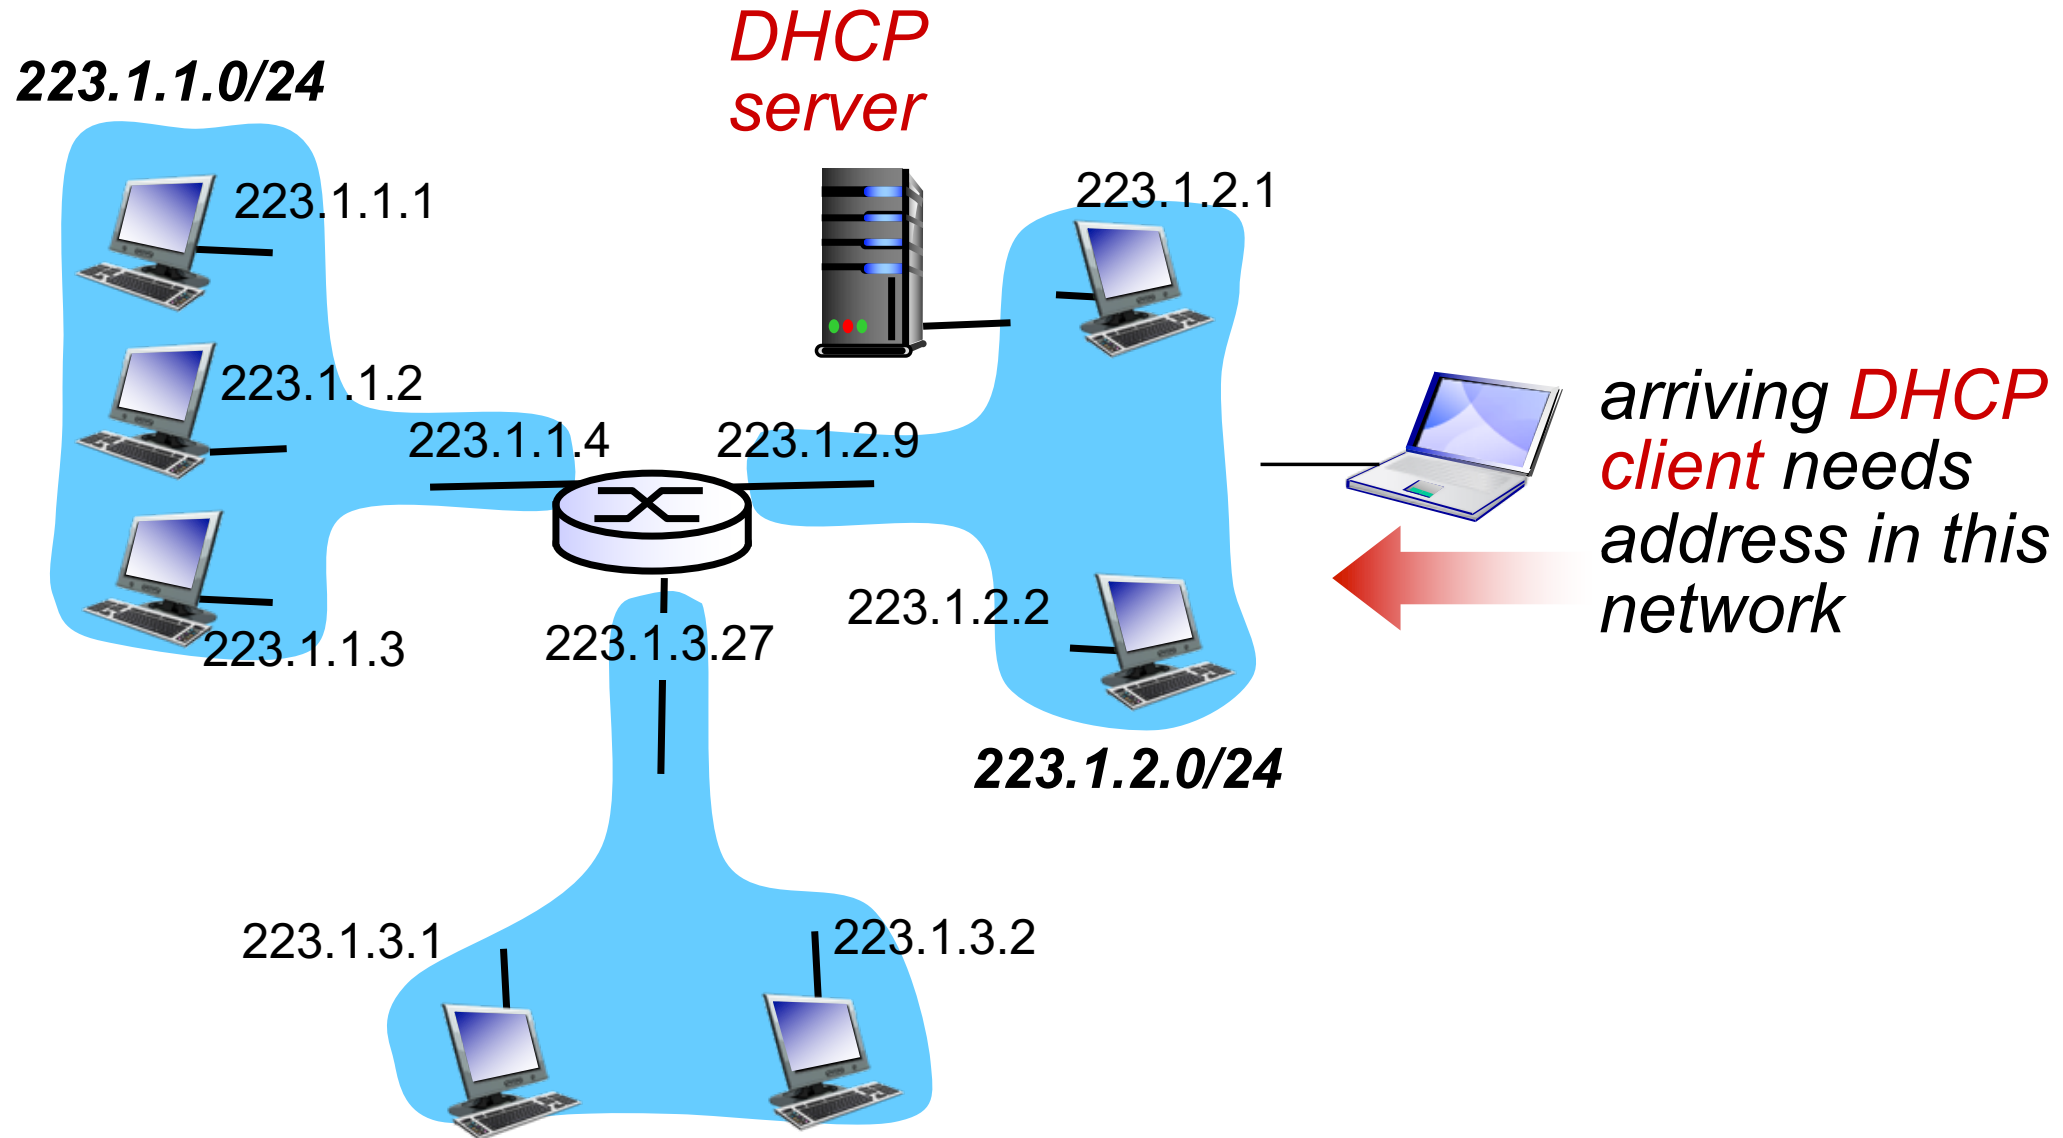

9

- Let's say that a ISP has  $X$  customers, How many IPs does it need to have?
  - $X$ ?
- Goal: allow host to *dynamically* obtain its IP address from network server when it joins network
  - can renew its lease on address in use
  - allows reuse of addresses (only hold address while connected/“on”)
  - support for mobile users who want to join network (more shortly)

□

# DHCP Client-Server

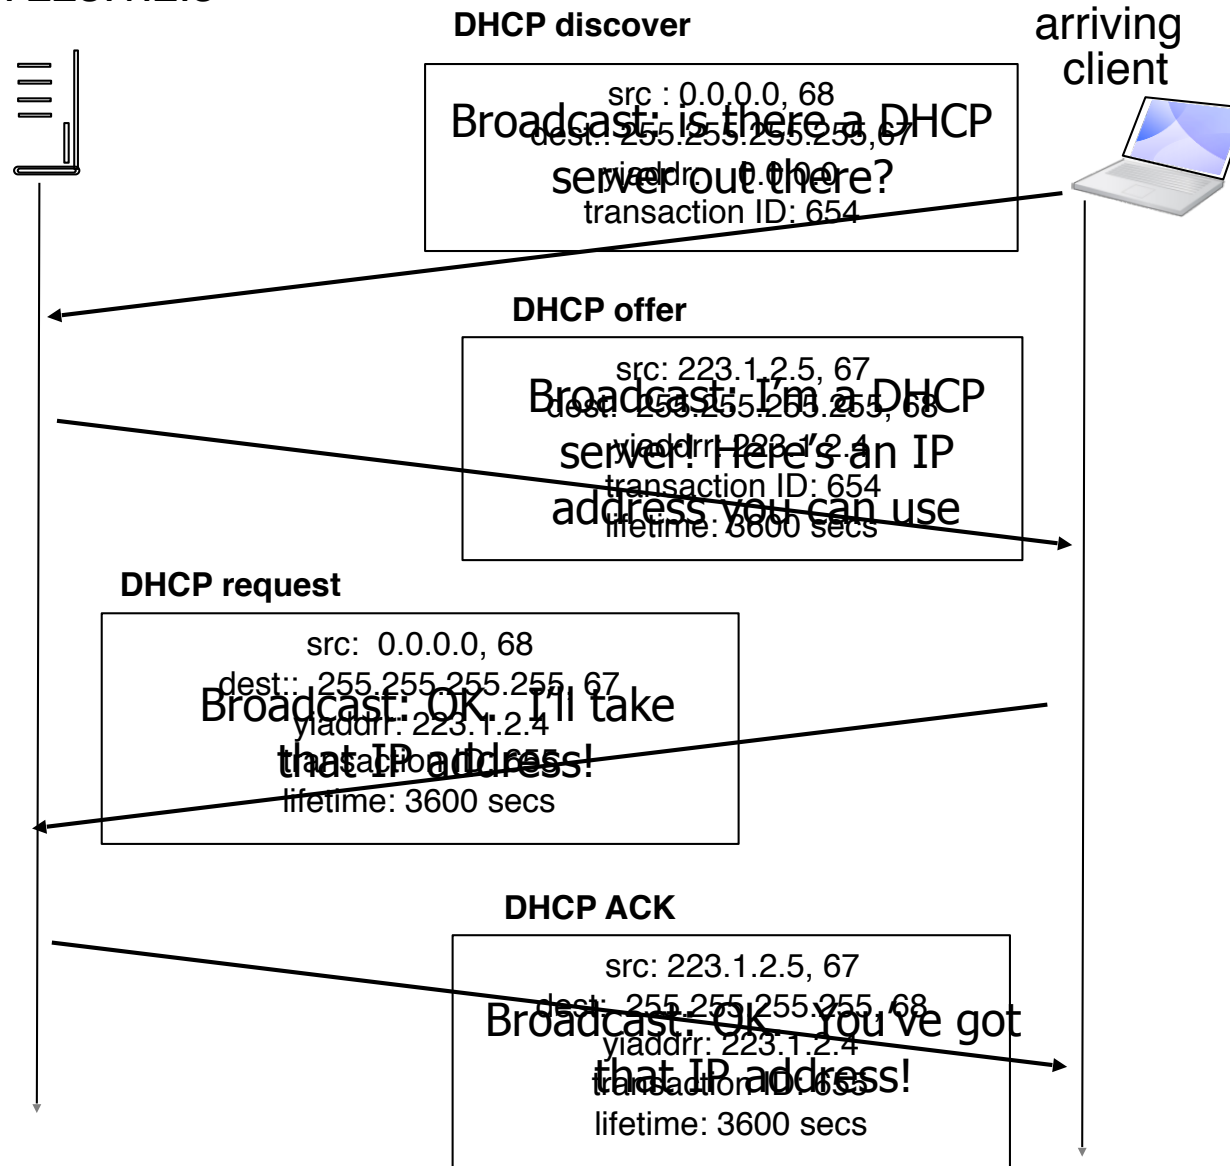

10

# DHCP Client-Server

11

DHCP server: 223.1.2.5

# DHCP: More than IP address

12

- DHCP can return more than just allocated IP address on subnet
  - address of first-hop router for client
  - name and IP address of DNS sever
  - network mask (indicating network versus host portion of address)

# DHCP Header (Do not memorize)

13

Dynamic Host Configuration Protocol				
Bit Offset	0–15		16–31	
0	OpCode	Hardware Type	Hardware Length	Hops
32	Transaction ID			
64	Seconds Elapsed		Flags	
96	Client IP Address			
128	Your IP Address			
160	Server IP Address			
196	Gateway IP Address			
228+	Client Hardware Address (16 bytes)			
	Server Host Name (64 bytes)			
	Boot File (128 bytes)			
	Options			

# CSCI-351

# DATA COMMUNICATION AND NETWORKS

## **Lecture 12: DNS**

# Layer 8 (The Carbon-based nodes)

15

- If you want to...
  - ▣ Call someone, you need to ask for their phone number
    - You can't just dial "P R O F C H U N G"
  - ▣ Mail someone, you need to get their address first
- What about the Internet?
  - ▣ If you need to reach Google, you need their IP
  - ▣ Does anyone know Google's IP?
- Problem:
  - ▣ People can't remember IP addresses
  - ▣ Need human readable names that map to IPs

# Internet Names and Addresses

16

- Addresses, e.g. 129.10.117.100
  - ▣ Computer usable labels for machines
  - ▣ Conform to structure of the network
- Names, e.g. www.rit.edu
  - ▣ Human usable labels for machines
  - ▣ Conform to organizational structure
- How do you map from one to the other?
  - ▣ Domain Name System (DNS)

# History

17

- Before DNS, all mappings were in *hosts.txt*
  - ▣ */etc/hosts* on Linux
  - ▣ *C:\Windows\System32\drivers\etc\hosts* on Windows
- Centralized, manual system
  - ▣ Changes were submitted to SRI via email
  - ▣ Machines periodically FTP new copies of *hosts.txt*
  - ▣ Administrators could pick names at their discretion
  - ▣ Any name was allowed
    - *tijay\_server\_at\_rit\_pwns\_joo\_lol\_kthxbye*

# Towards DNS

18

- Eventually, the *hosts.txt* system fell apart
  - ▣ Not scalable, SRI couldn't handle the load
  - ▣ Hard to enforce uniqueness of names
    - e.g RIT
      - ▣ Rochester Institute of Technology?
      - ▣ Revolution in Training (US Navy)
  - ▣ Many machines had inaccurate copies of *hosts.txt*
- Thus, DNS was born

# 19 Outline

- ❑ DNS Basics
- ❑ DNS Security

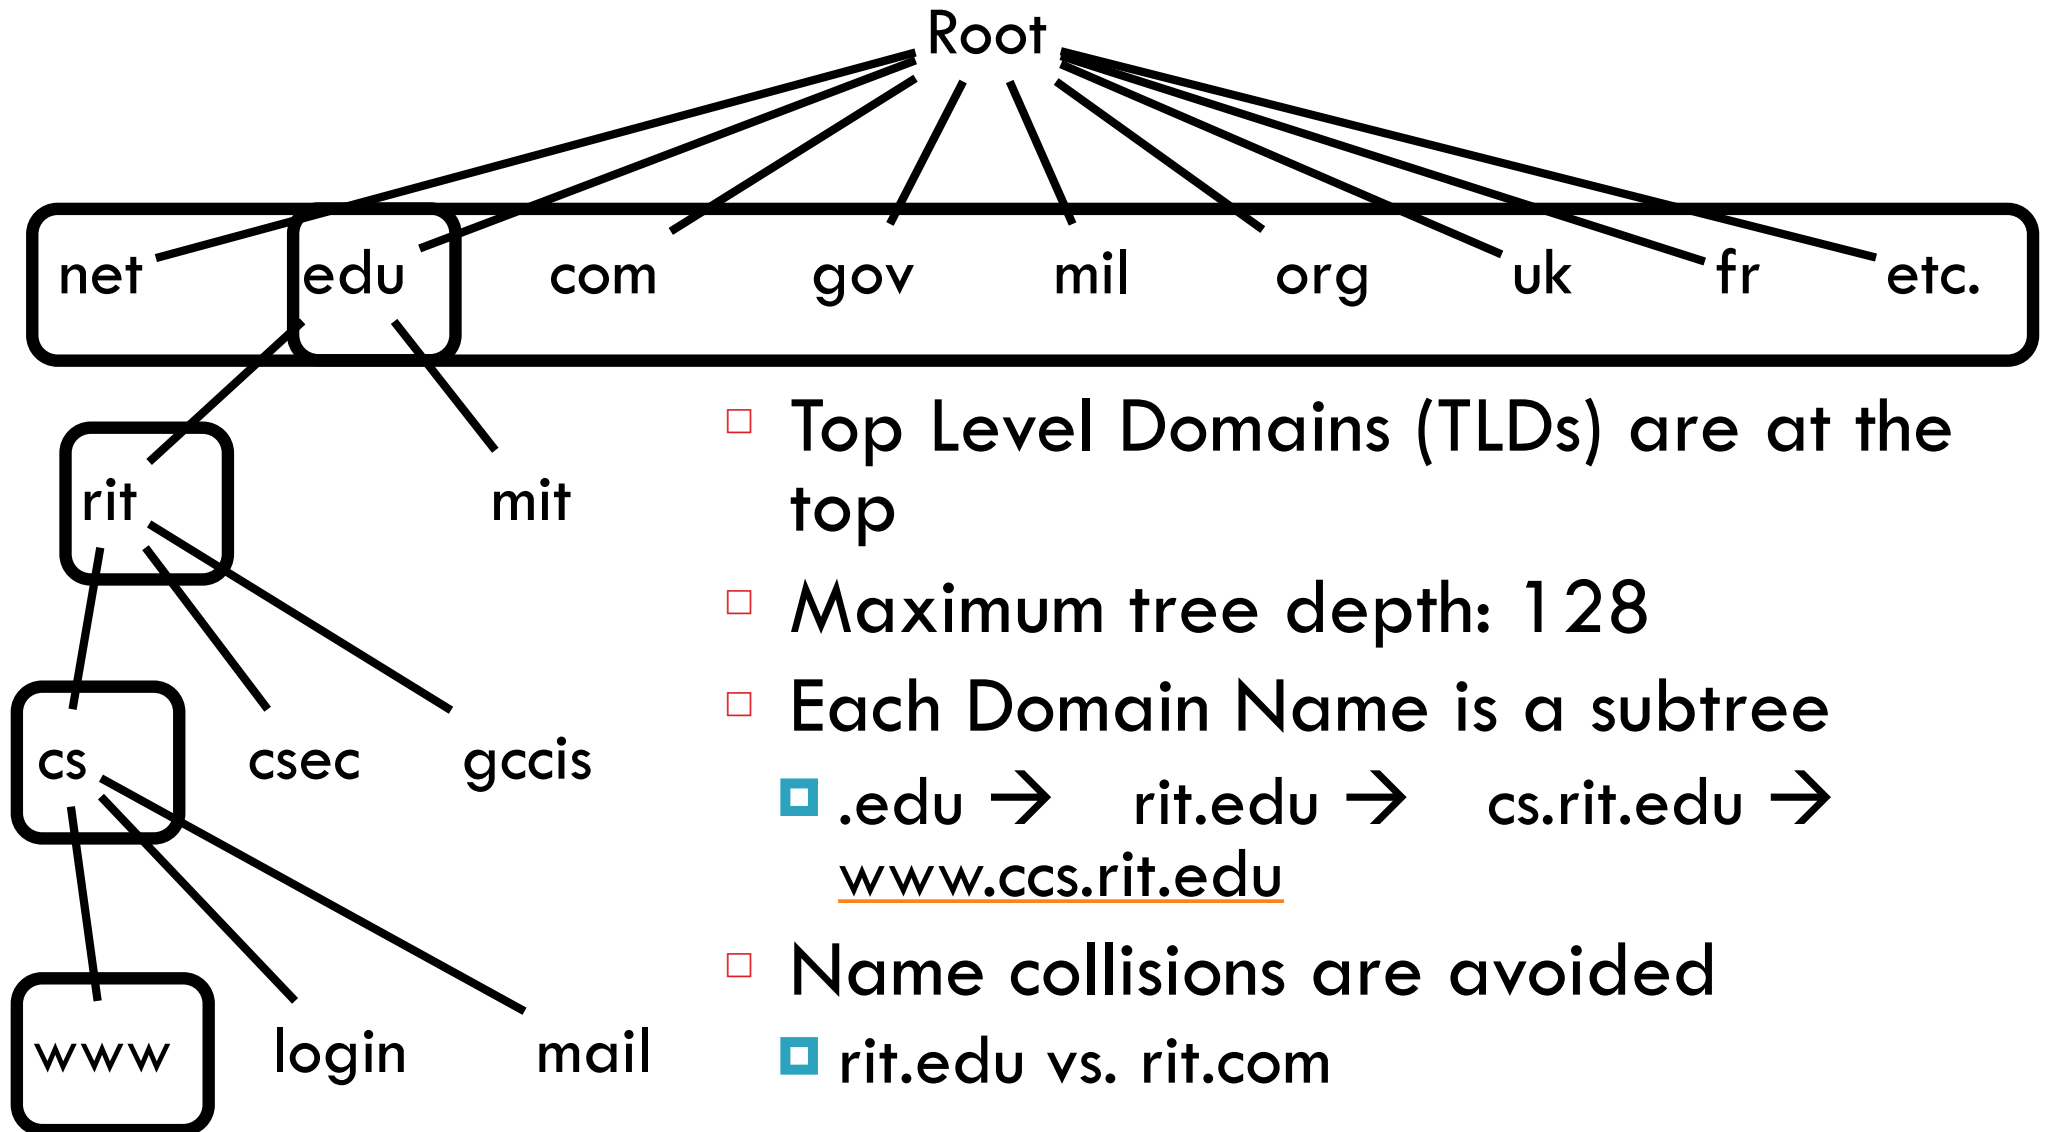

# DNS at a High-Level

20

- Domain Name System
- Distributed database
  - ▣ No centralization
- Simple client/server architecture
  - ▣ UDP port 53, some implementations also use TCP
  - ▣ Why? (You will learn at the TCP-lecture)
- Hierarchical namespace
  - ▣ As opposed to original, flat namespace
  - ▣ e.g. .com → google.com → mail.google.com

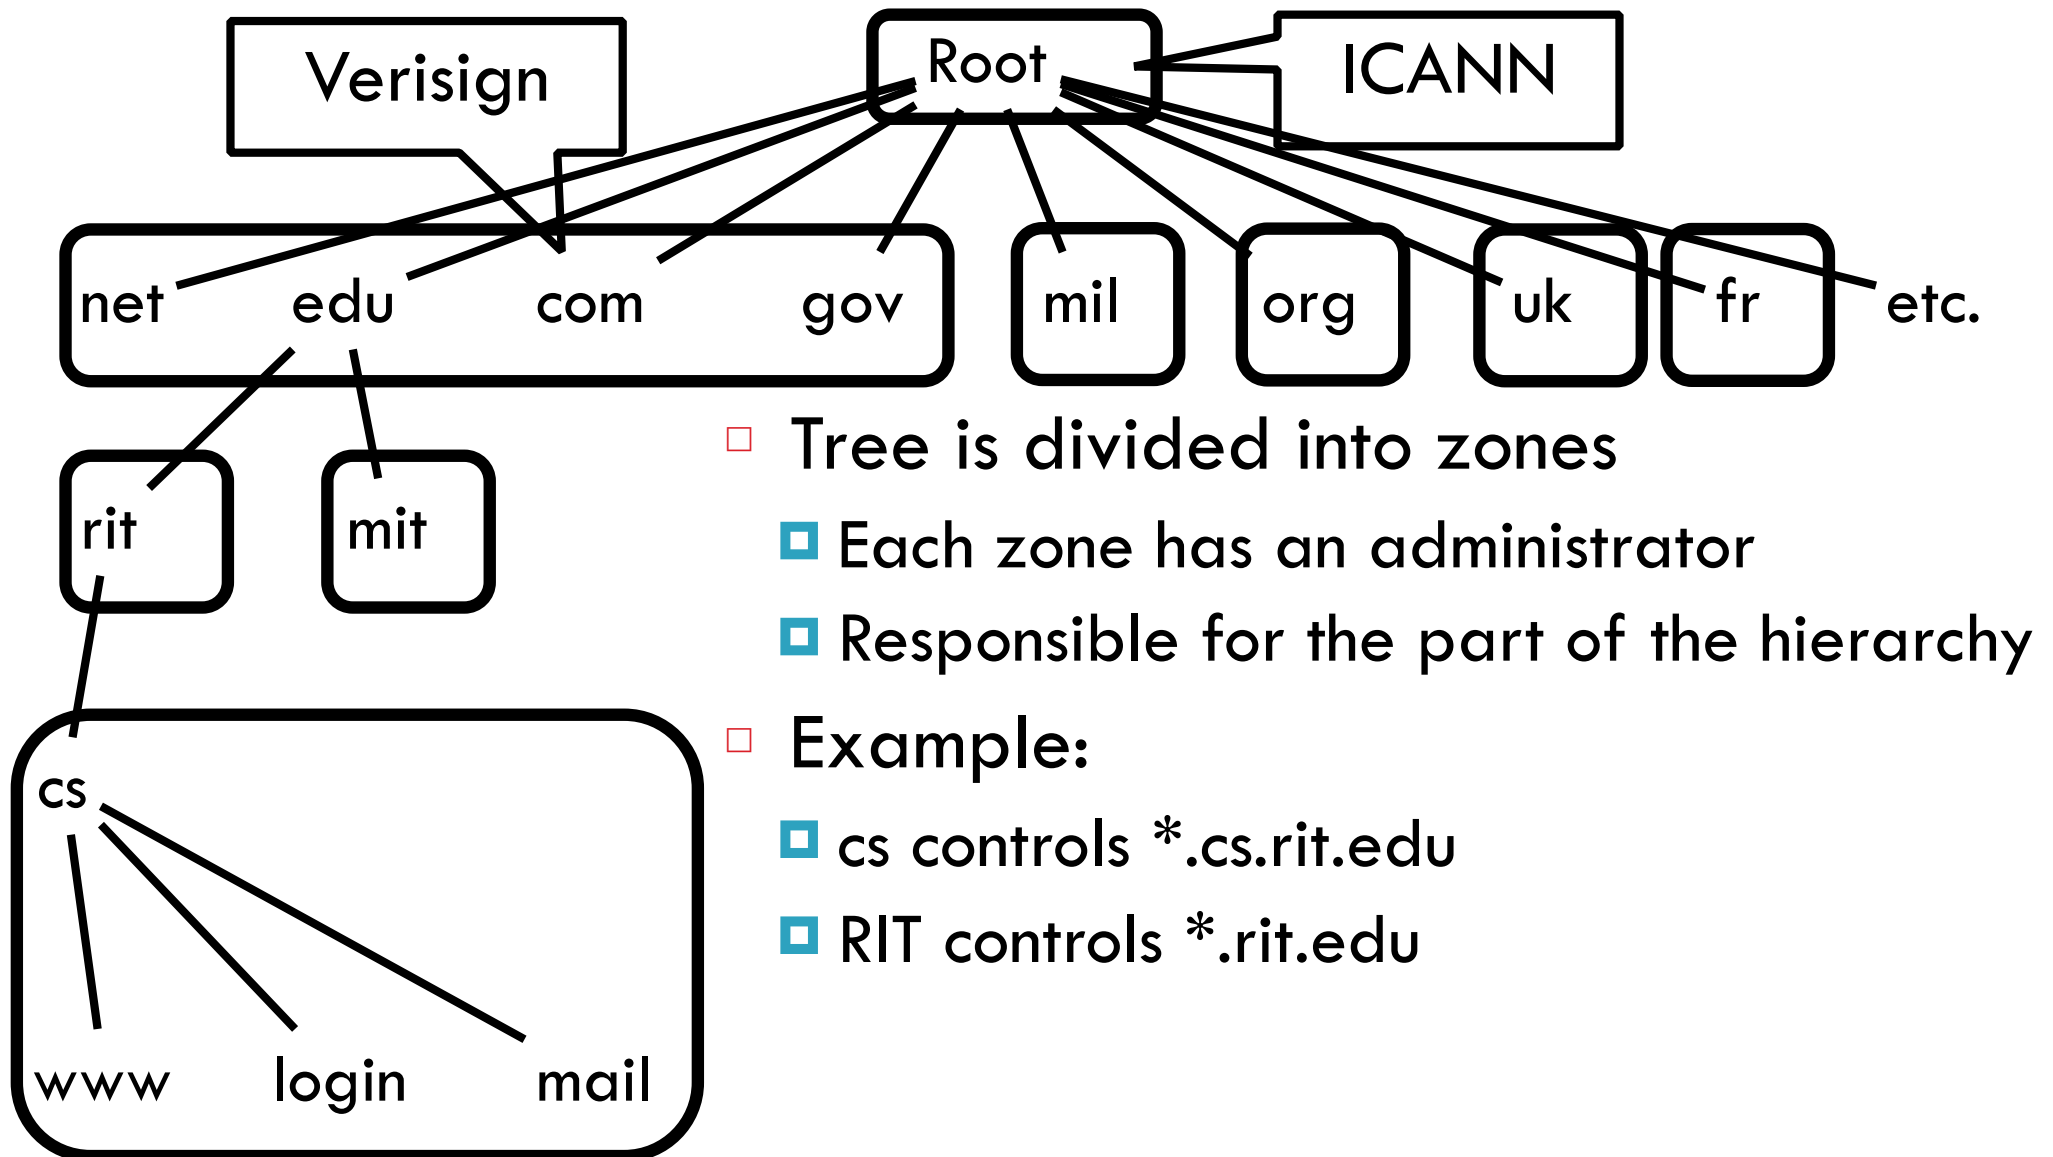

# Naming Hierarchy

21

# Hierarchical Administration

22

# Server Hierarchy

23

- Functions of each DNS server:
  - ▣ Authority over a portion of the hierarchy
    - No need to store all DNS names
  - ▣ Store all the records for hosts/domains in its zone
    - May be replicated for robustness
  - ▣ Know the addresses of the root servers
    - Resolve queries for unknown names
- Root servers know about all TLDs
  - ▣ The buck stops at the root servers

# Root Name Servers

24

- Responsible for the Root Zone File
  - ▣ Lists the TLDs and who controls them
  - ▣ ~272KB in size

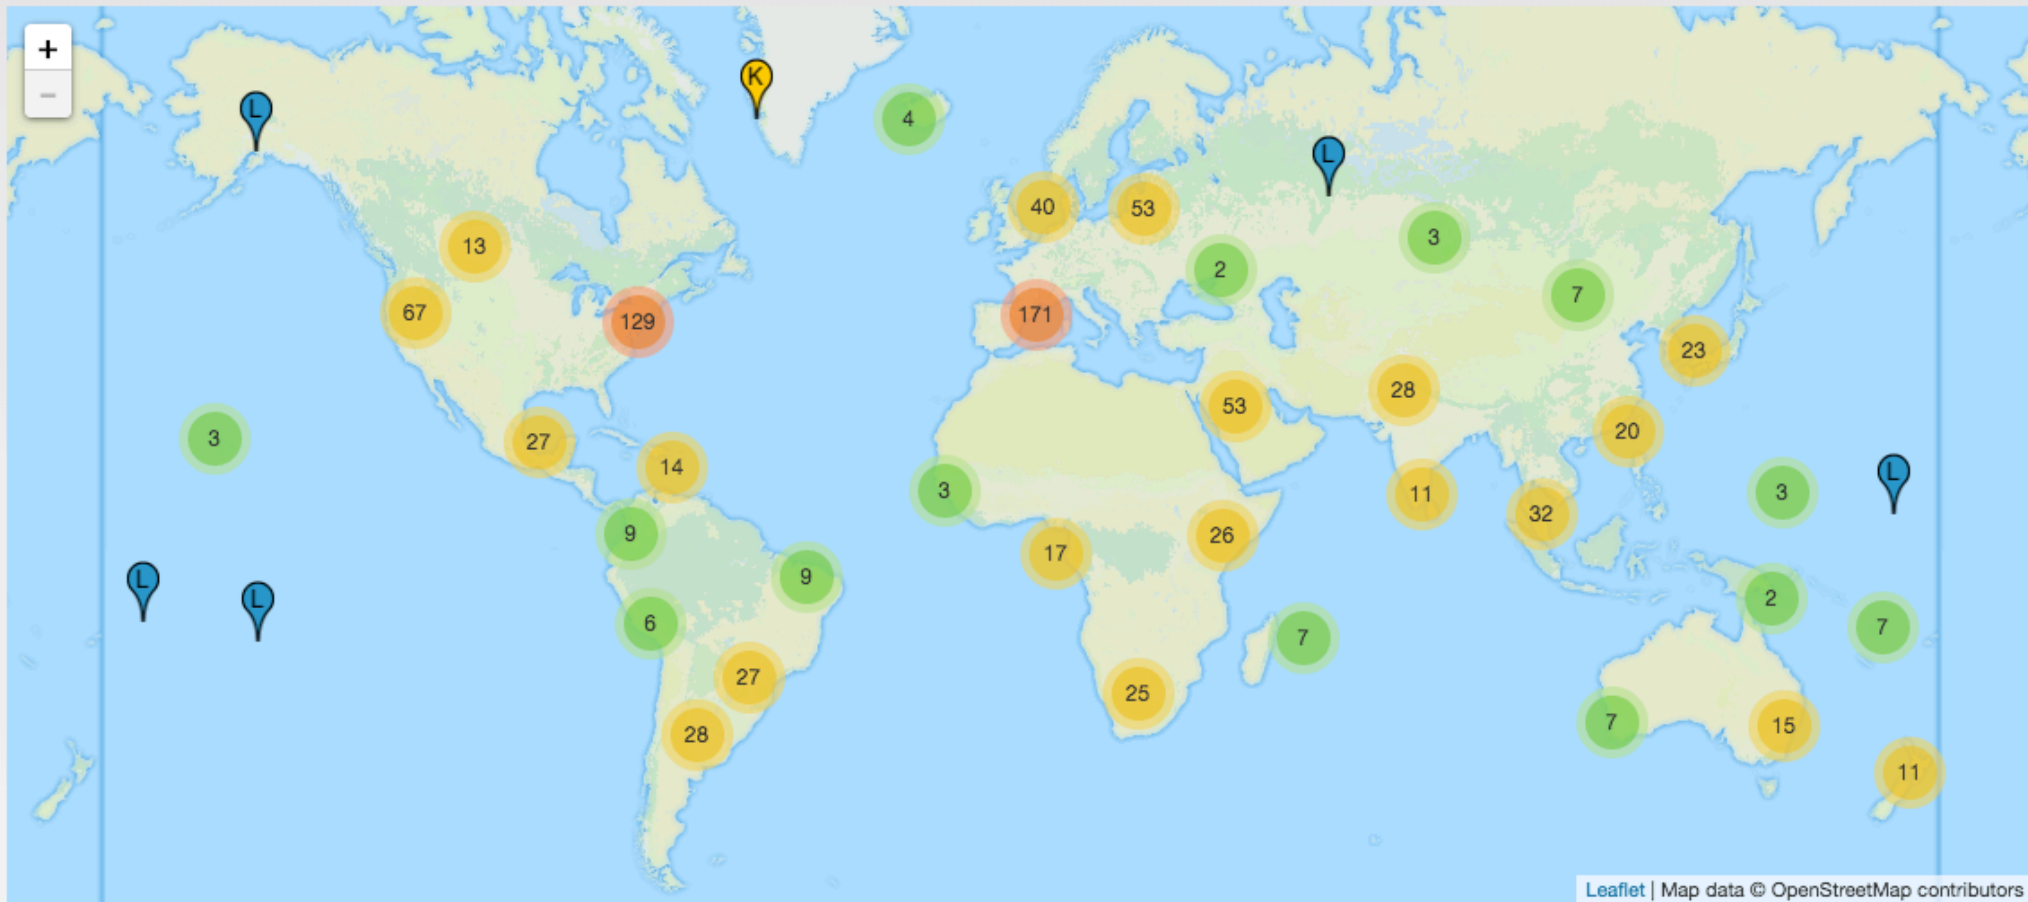

com.	172800	IN	NS	a.gtld-servers.net.
com.	172800	IN	NS	b.gtld-servers.net.
com.	172800	IN	NS	c.gtld-servers.net.

- Administered by ICANN
  - ▣ 13 root servers, labeled A→M
  - ▣ 6 are anycasted, i.e. they are globally replicated
- Contacted when names cannot be resolved
  - ▣ In practice, most systems cache this information

# Map of the Roots (root-servers.org)

25

As of 2018-10-02, the root server system consists of 908 instances operated by the 12 independent root server operators.

# Local Name Servers (Resolvers)

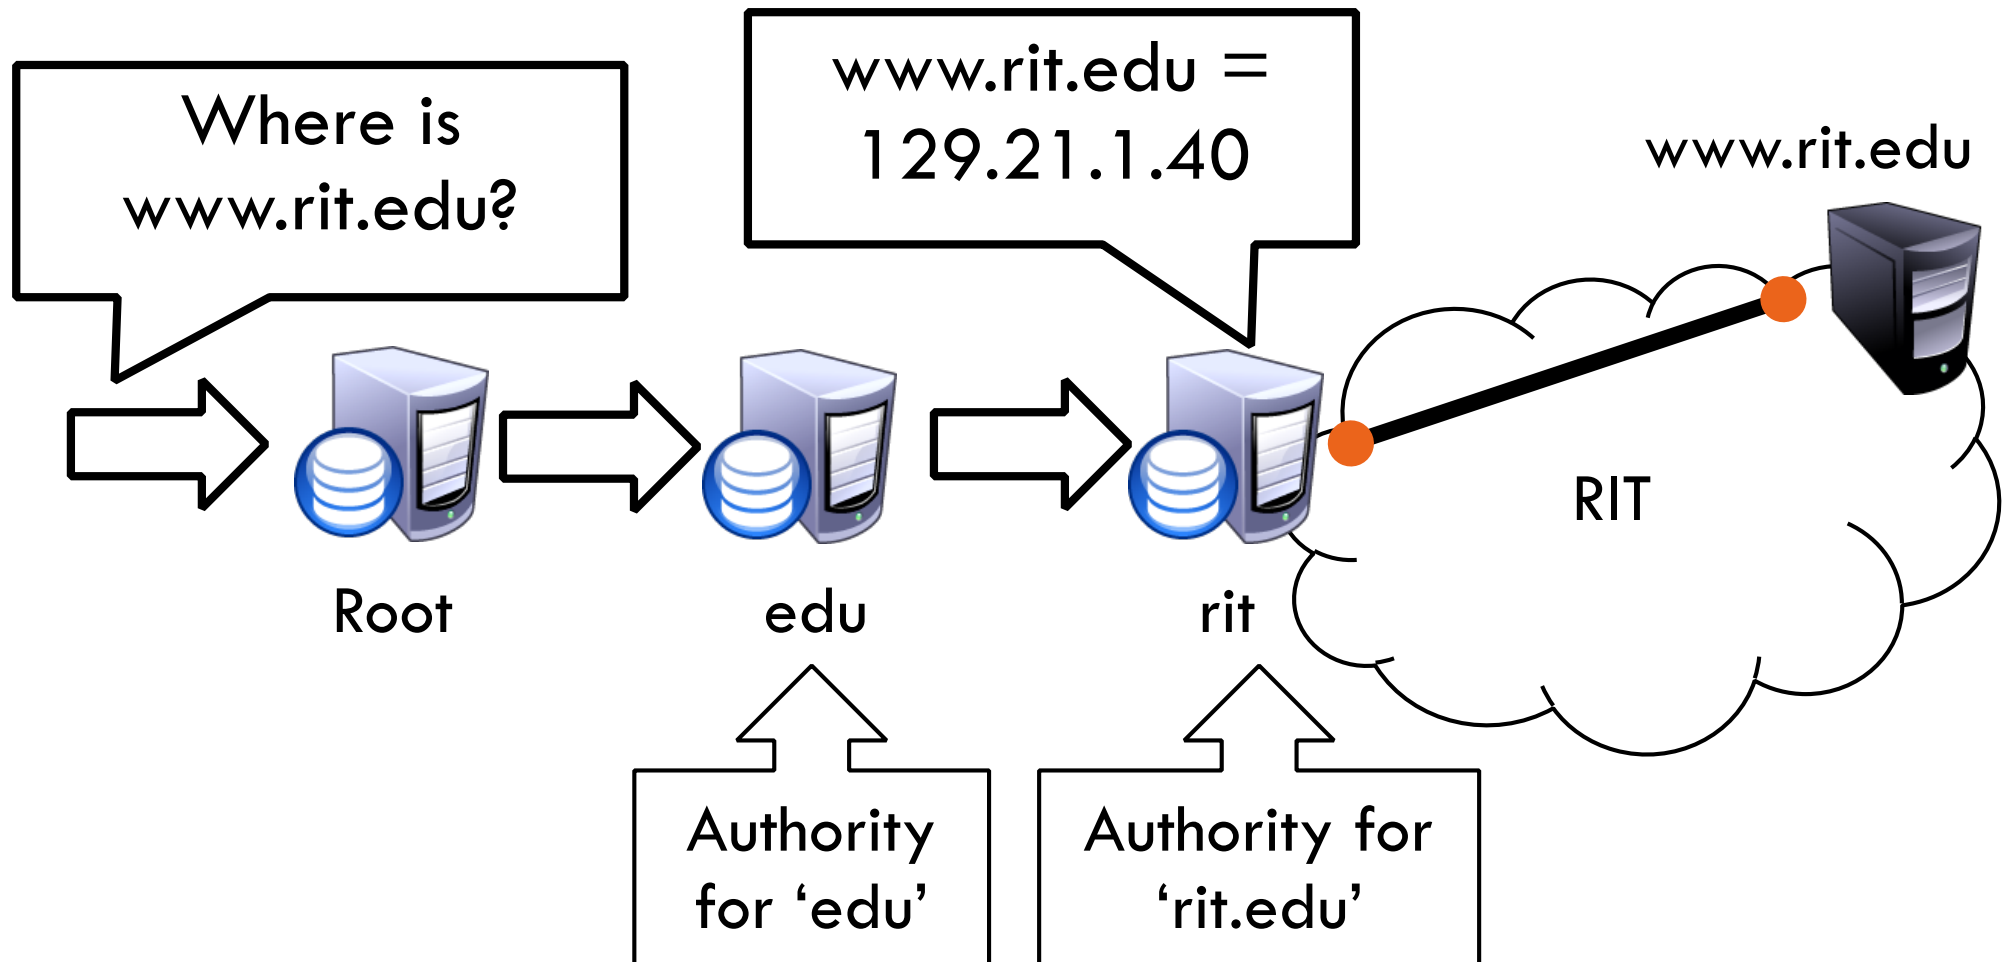

26

- ❑ Each ISP/company has a local, default name server
- ❑ Often configured via DHCP
- ❑ Hosts begin DNS queries by contacting the local name server
- ❑ Frequently cache query results

# Authoritative Name Servers

27

- Stores the name → IP mapping for a given host

# Basic Domain Name Resolution

28

- Every host knows a local DNS server
  - ▣ Sends all queries to the local DNS server
- If the local DNS can answer the query, then you're done
  1. Local server has cached the record for that name
- Otherwise, go down the hierarchy and search for the authoritative name server
  - ▣ Every local DNS server knows the root servers
  - ▣ Use cache to skip steps if possible
    - e.g. skip the root and go directly to .edu if the root file is cached

# Recursive DNS Query

29

Where is `www.google.com`?

- Puts the burden of resolution on the contacted name server
- How does glados know who to forward responses too?
  - ▣ Random IDs embedded in DNS queries
- What have we said about keeping state in the network?

# Iterated DNS query

30

Where is `www.google.com`?

- Contact server replies with the name of the next authority in the hierarchy
- “I don’t know this name, but this other server might”
- This is how DNS works today

# DNS Propagation

31

- How many of you have purchased a domain name?
  - ▣ Did you notice that it took ~72 hours for your name to become accessible?
  - ▣ This delay is called DNS Propagation

# Caching vs. Freshness

32

- DNS Propagation delay is caused by caching

- Zone files may be cached for 1-72 hours

# DNS Resource Records

33

- ❑ DNS queries have two fields: name and type
- ❑ Resource record is the response to a query
  - ▣ Four fields: (name, value, type, TTL)
  - ▣ There may be multiple records returned for one query
- ❑ What are do the name and value mean?
  - ▣ Depends on the type of query and response

### DNS header:

00	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
<u>Identification</u>																<u>QR</u>	<u>Opcode</u>				<u>AA</u>	<u>TC</u>	<u>RD</u>	<u>RA</u>	<u>Z</u>	<u>AD</u>	<u>CD</u>	<u>Rcode</u>			
<u>Total Questions</u>																<u>Total Answer RRs</u>															
<u>Total Authority RRs</u>																<u>Total Additional RRs</u>															
<u>Questions</u> [] ::																															
<u>Answer RRs</u> [] ::																															
<u>Authority RRs</u> [] ::																															
<u>Additional RRs</u> [] ::																															

# DNS Types

34

- Type = NS
  - ▣ Name = partial domain
  - ▣ Value = name of DNS server for this domain
  - ▣ “Go send your query to this other server”
  
- Type = A / AAAA
  - ▣ Name = domain name
  - ▣ Value = IP address
  - ▣ A is IPv4, AAAA is IPv6

Query

Name: rit.edu  
Type: NS

Resp.

Name: rit.edu  
Value: ns1 a.rit.edu.

Query

Name: www.rit.edu  
Type: A

Resp.

Name: www.rit.edu  
Value: 129.10.116.81

# DNS Types, Continued

35

## □ Type = CNAME

- ▣ Name = hostname
- ▣ Value = canonical hostname
- ▣ Useful for aliasing
- ▣ CDNs use this (will be covered)

Query

Name: foo.mysite.com  
Type: CNAME

Resp.

Name: foo.mysite.com  
Value: bar.mysite.com

## □ Type = MX

- ▣ Name = domain in email address
- ▣ Value = canonical name of mail server

Query

Name: cs.rit.edu  
Type: MX

Resp.

Name: cs.rit.edu  
Value: pony-express.cs.rit.edu.

# Reverse Lookups

36

- What about the IP → name mapping?
- Separate server hierarchy stores reverse mappings
  - ▣ Rooted at in-addr.arpa and ip6.arpa
- Additional DNS record type: PTR
  - ▣ Name = IP address
  - ▣ Value = domain name
- Not guaranteed to exist for all IPs
- Why do we need this?

Query

Name: 129.10.116.51  
Type: PTR

Resp.

Name: 129.21.30.104  
Value: cs.rit.edu

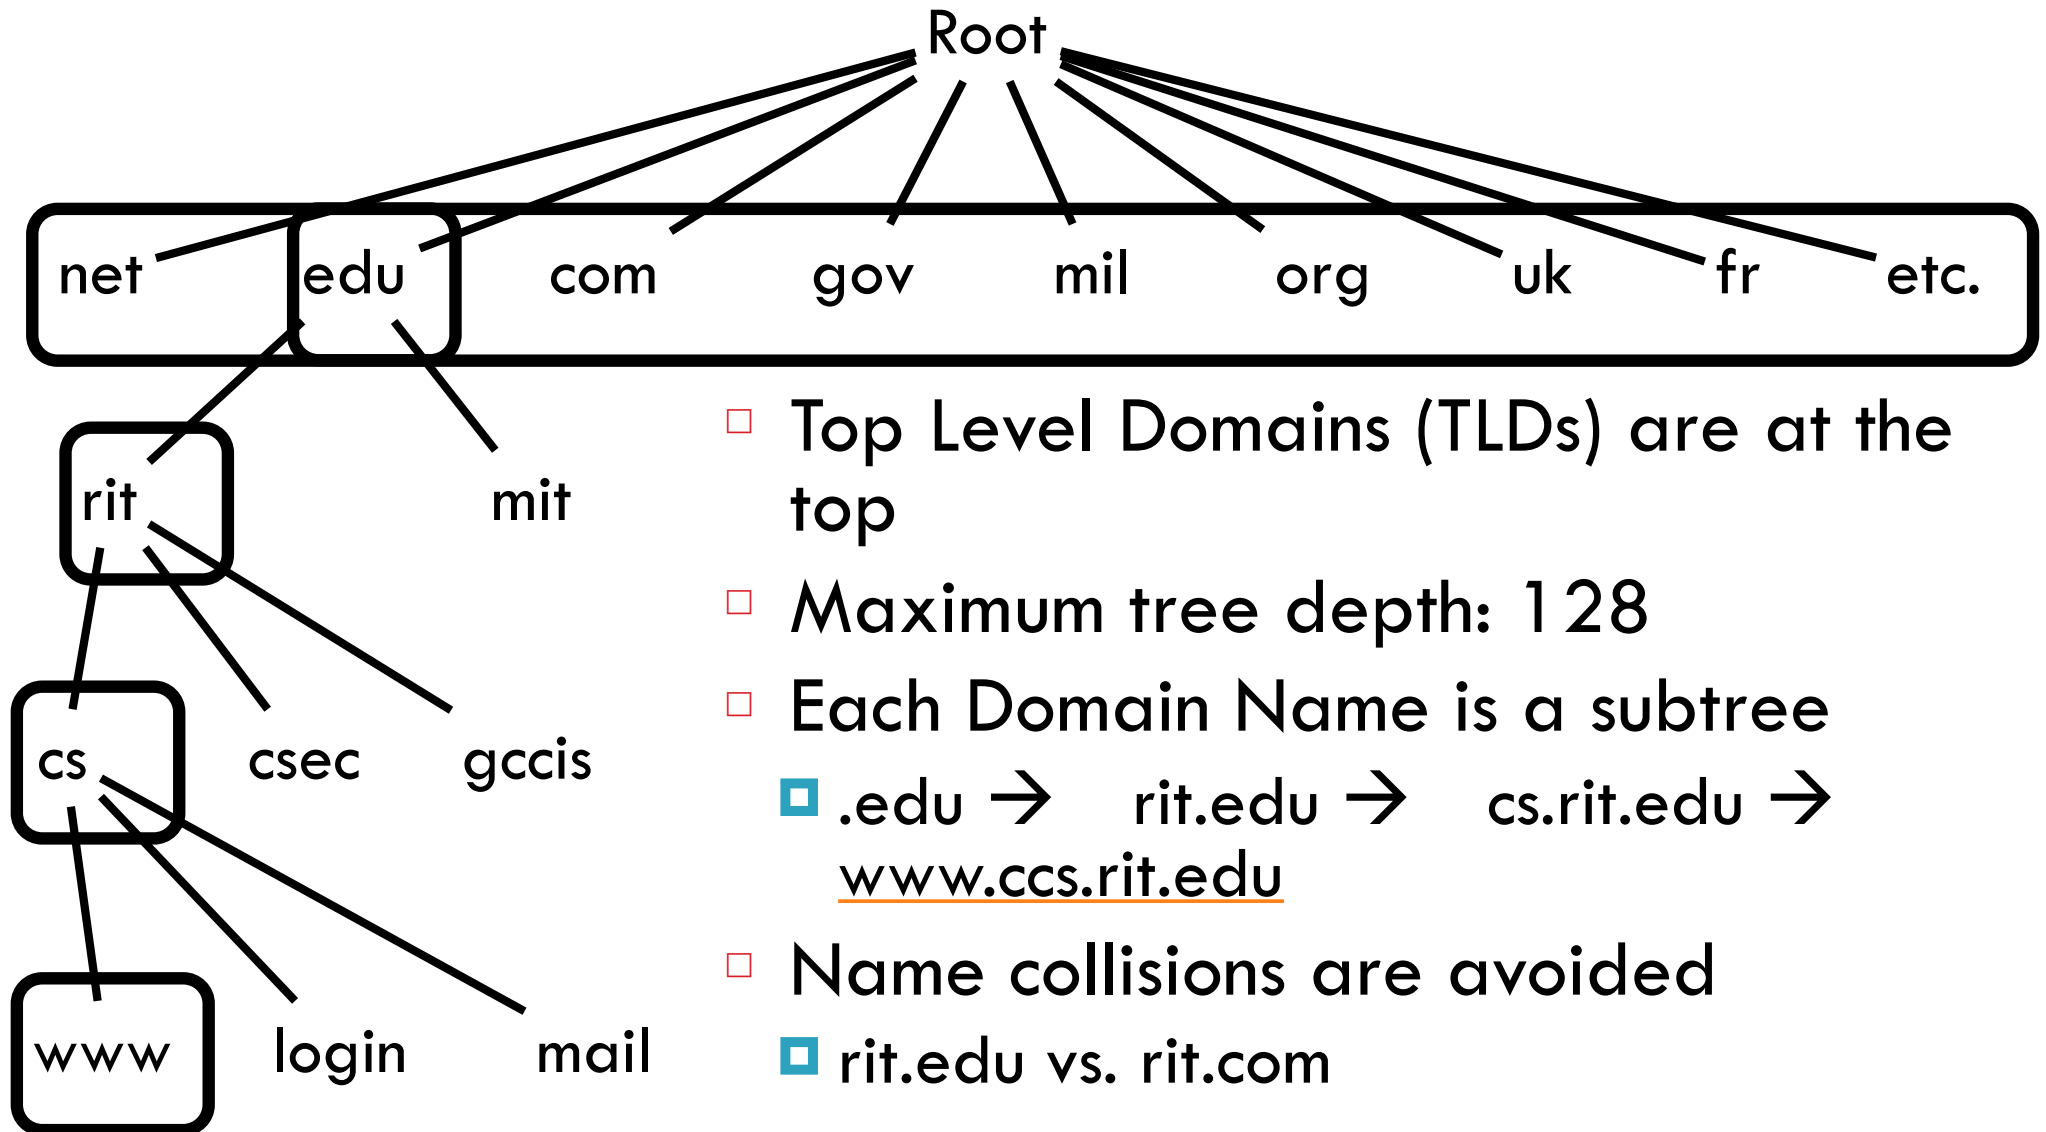

# DNS Recap

37

  - Resolver
- How to buy a domain name

# Naming Hierarchy

38

# Authoritative Nameserver

39

*What is the IP address of rit.edu?*  
\_\_\_\_\_→

What is the mail server address of rit.edu?  
\_\_\_\_\_→

Do you have other names than rit.edu?  
\_\_\_\_\_→

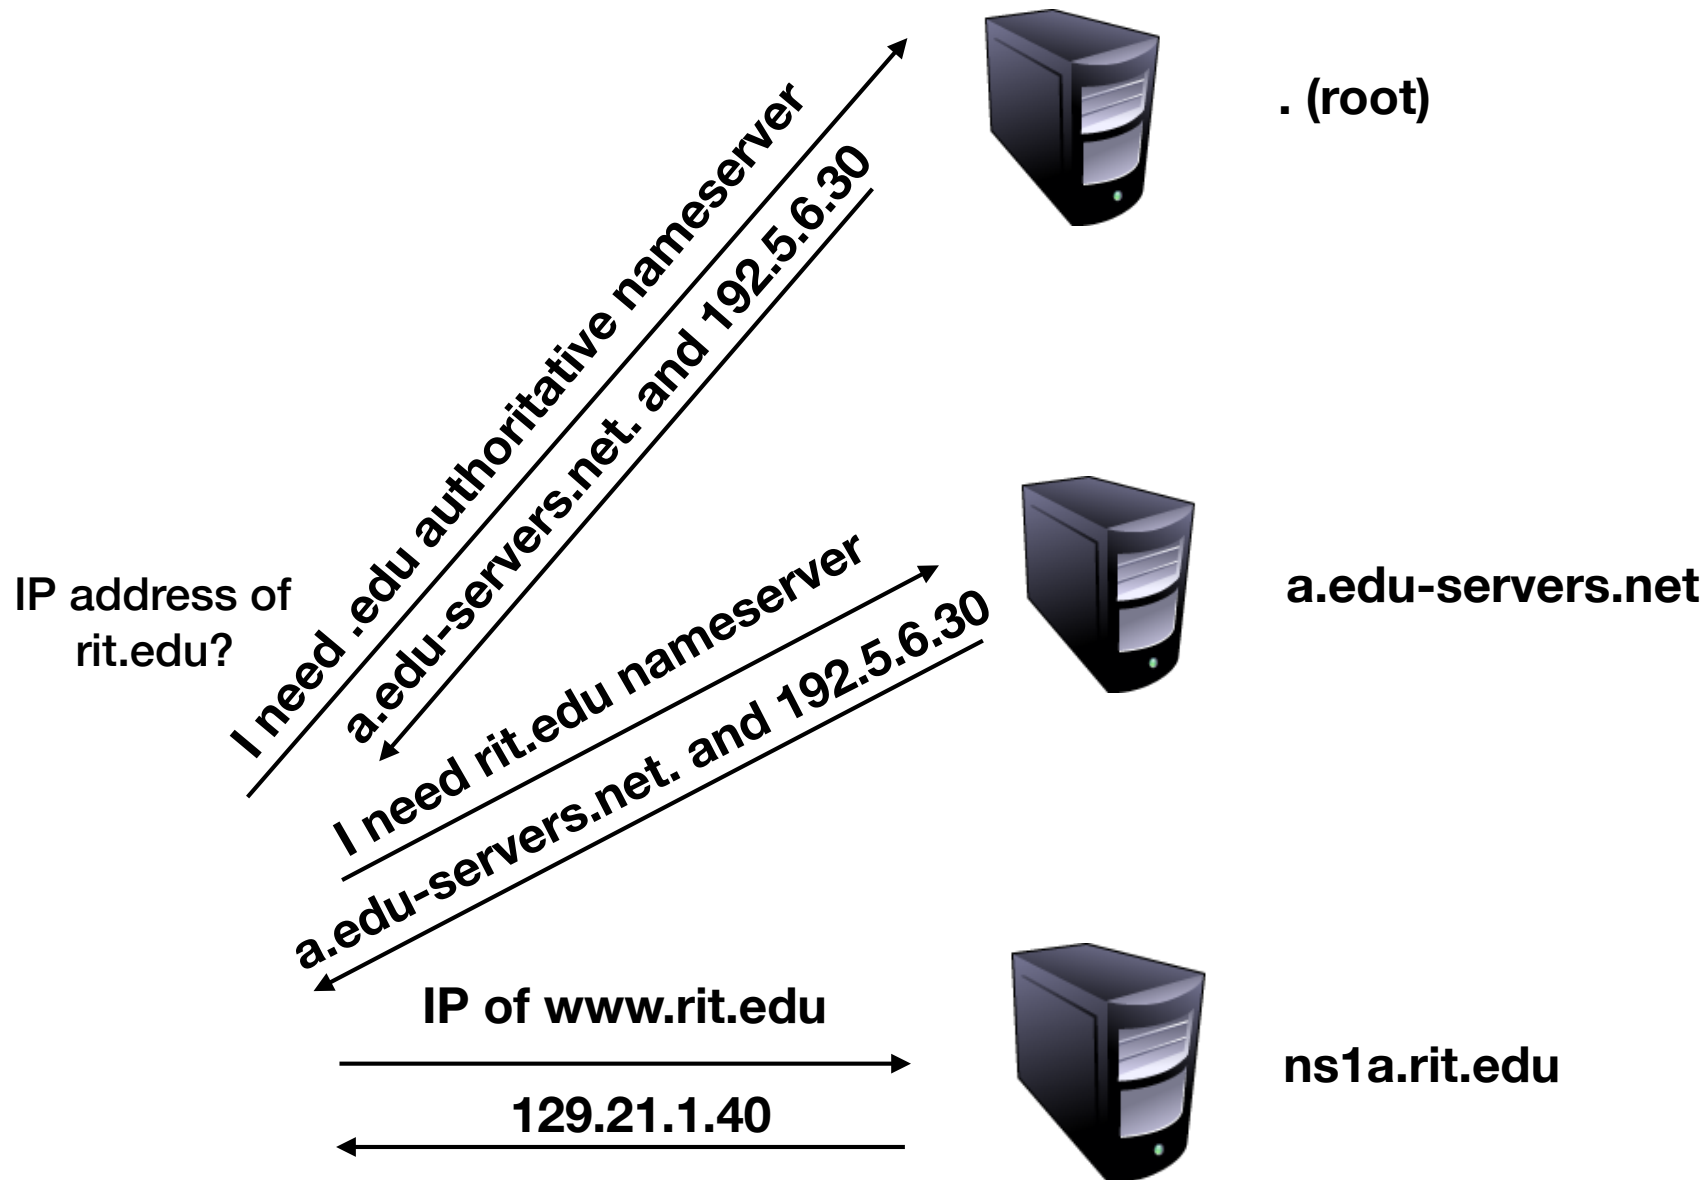

*What is your IPv6 address?*  
\_\_\_\_\_→

ns1a.rit.edu

# Authoritative Nameserver

40

# Demo 1

41

- Dig: (Domain Information Grouper)
  - Very useful tool to send a DNS request and parse the DNS response

## List of Root Servers

HOSTNAME	IP ADDRESSES	MANAGER
a.root-servers.net	198.41.0.4, 2001:503:ba3e::2:30	VeriSign, Inc.
b.root-servers.net	199.9.14.201, 2001:500:200::b	University of Southern California (ISI)
c.root-servers.net	192.33.4.12, 2001:500:2::c	Cogent Communications
d.root-servers.net	199.7.91.13, 2001:500:2d::d	University of Maryland
e.root-servers.net	192.203.230.10, 2001:500:a8::e	NASA (Ames Research Center)
f.root-servers.net	192.5.5.241, 2001:500:2f::f	Internet Systems Consortium, Inc.
g.root-servers.net	192.112.36.4, 2001:500:12::d0d	US Department of Defense (NIC)
h.root-servers.net	198.97.190.53, 2001:500:1::53	US Army (Research Lab)
i.root-servers.net	192.36.148.17, 2001:7fe::53	Netnod
j.root-servers.net	192.58.128.30, 2001:503:c27::2:30	VeriSign, Inc.
k.root-servers.net	193.0.14.129, 2001:7fd::1	RIPE NCC
l.root-servers.net	199.7.83.42, 2001:500:9f::42	ICANN
m.root-servers.net	202.12.27.33, 2001:dc3::35	WIDE Project

# Resolver

42

Where is `www.google.com`?

- Contact server replies with the name of the next authority in the hierarchy
- “I don’t know this name, but this other server might”
- This is how DNS works today
- Cache!

# Demo 2

43

- Dig: (Domain Information Grouper)
  - Dig @1.1.1.1 rit.edu

# DNS Types

44

- Type = NS
  - ▣ Name = partial domain
  - ▣ Value = name of DNS server for this domain
  - ▣ “Go send your query to this other server”
  
- Type = A / AAAA
  - ▣ Name = domain name
  - ▣ Value = IP address
  - ▣ A is IPv4, AAAA is IPv6

Query

Name: rit.edu  
Type: NS

Resp.

Name: rit.edu  
Value: ns1 a.rit.edu.

Query

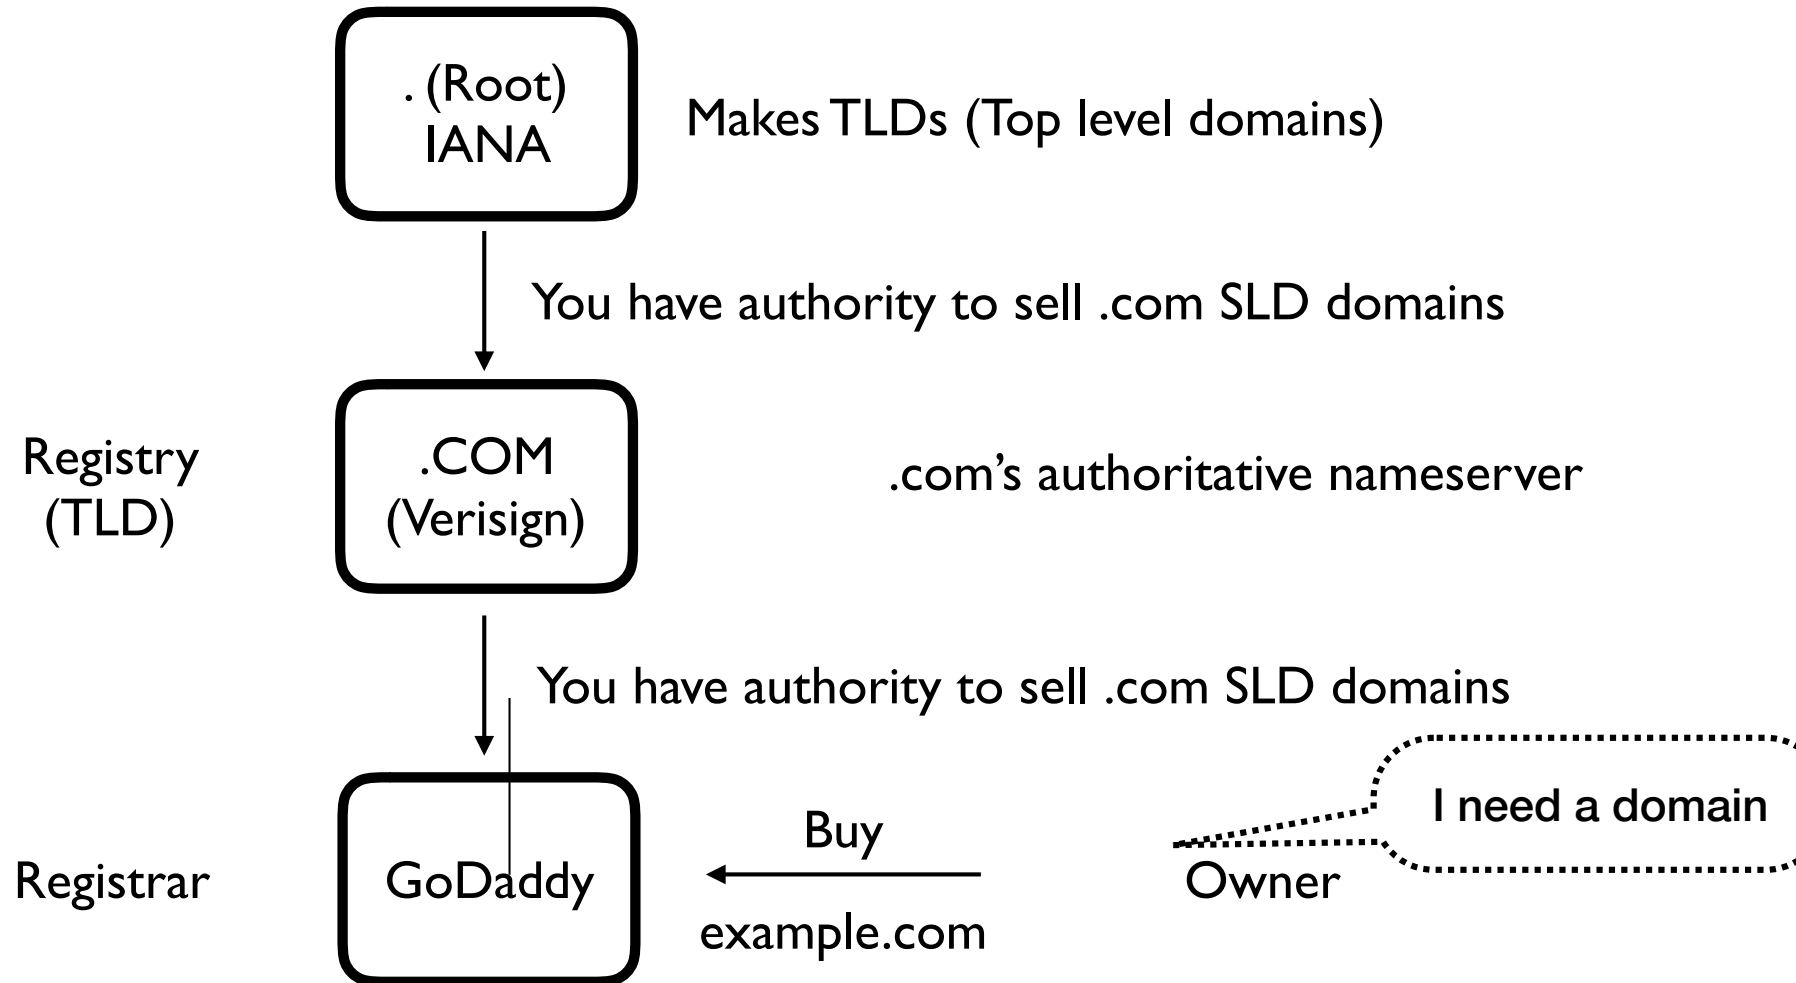

Name: www.rit.edu  
Type: A

Resp.

Name: www.rit.edu  
Value: 129.10.116.81

# How to buy a domain name (1)

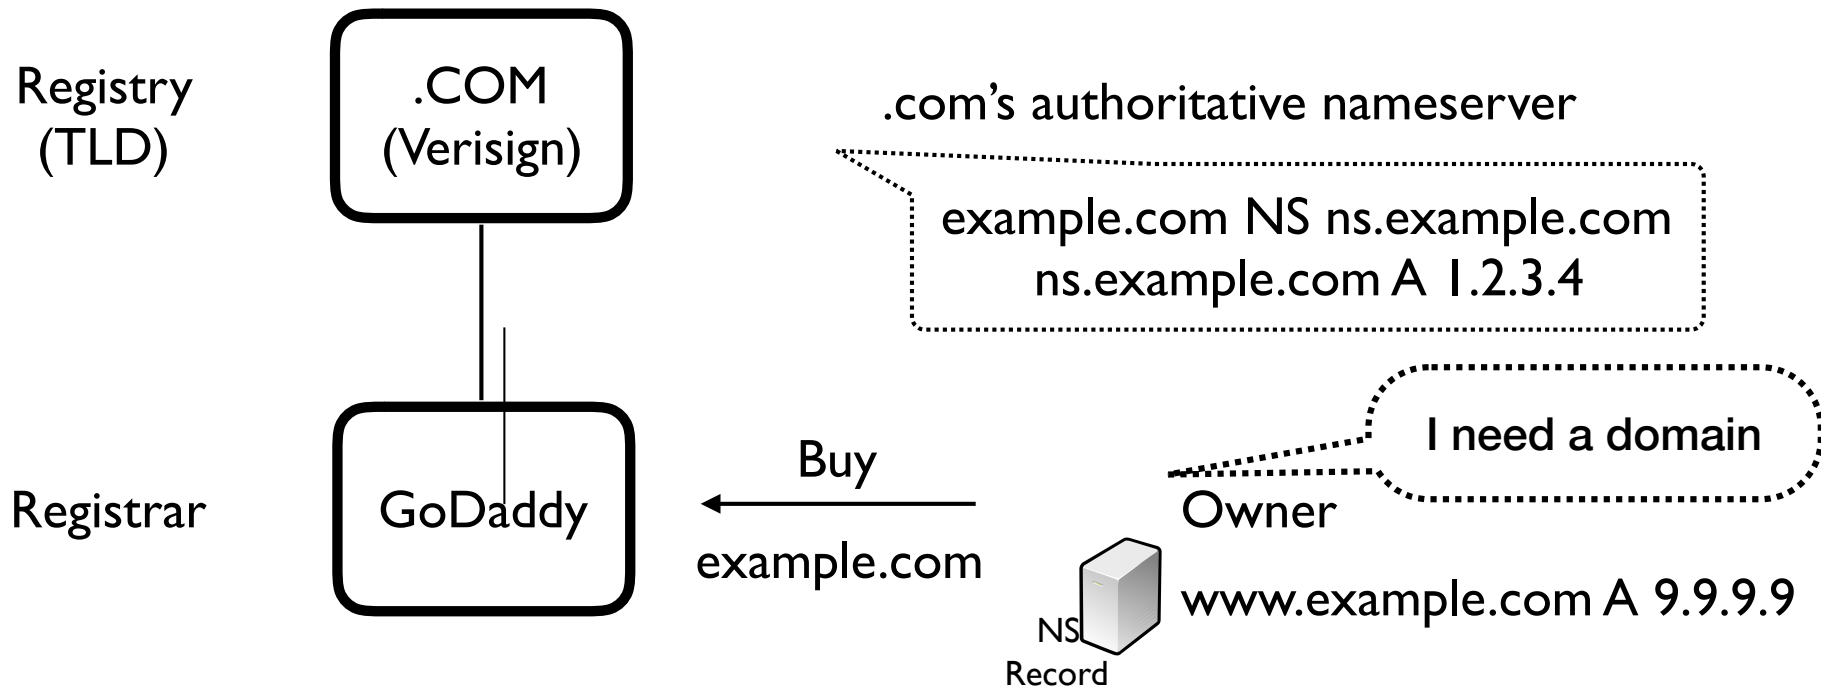

45

# How to buy a domain name (2)

## Using your own authoritative nameserver

46

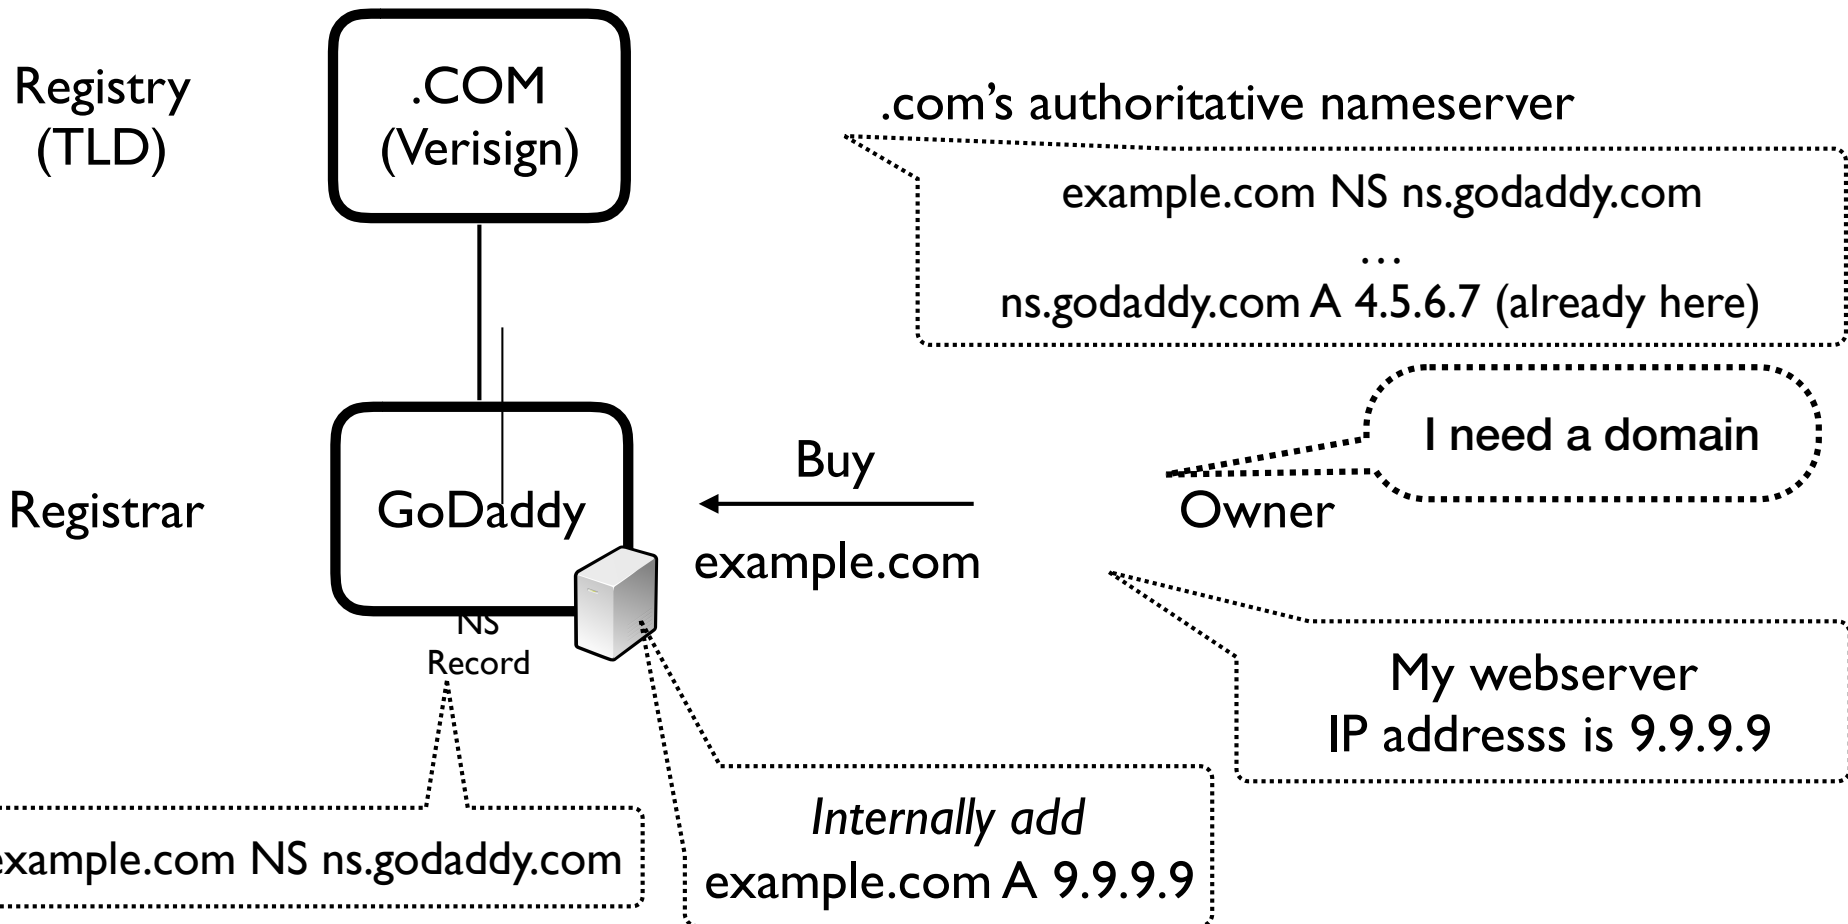

My nameserver name is  
ns.example.com and  
this is the IP address: 1.2.3.4.

# How to buy a domain name (3)

## Using the registrar's default nameserver

47

# DNS as Indirection Service

48

- DNS gives us very powerful capabilities
  - ▣ Not only easier for humans to reference machines!
  
- Changing the IPs of machines becomes trivial
  - ▣ e.g. you want to move your web server to a new host
  - ▣ Just change the DNS record!

# Aliasing and Load Balancing

49

- One machine can have many aliases (virtual hosting)

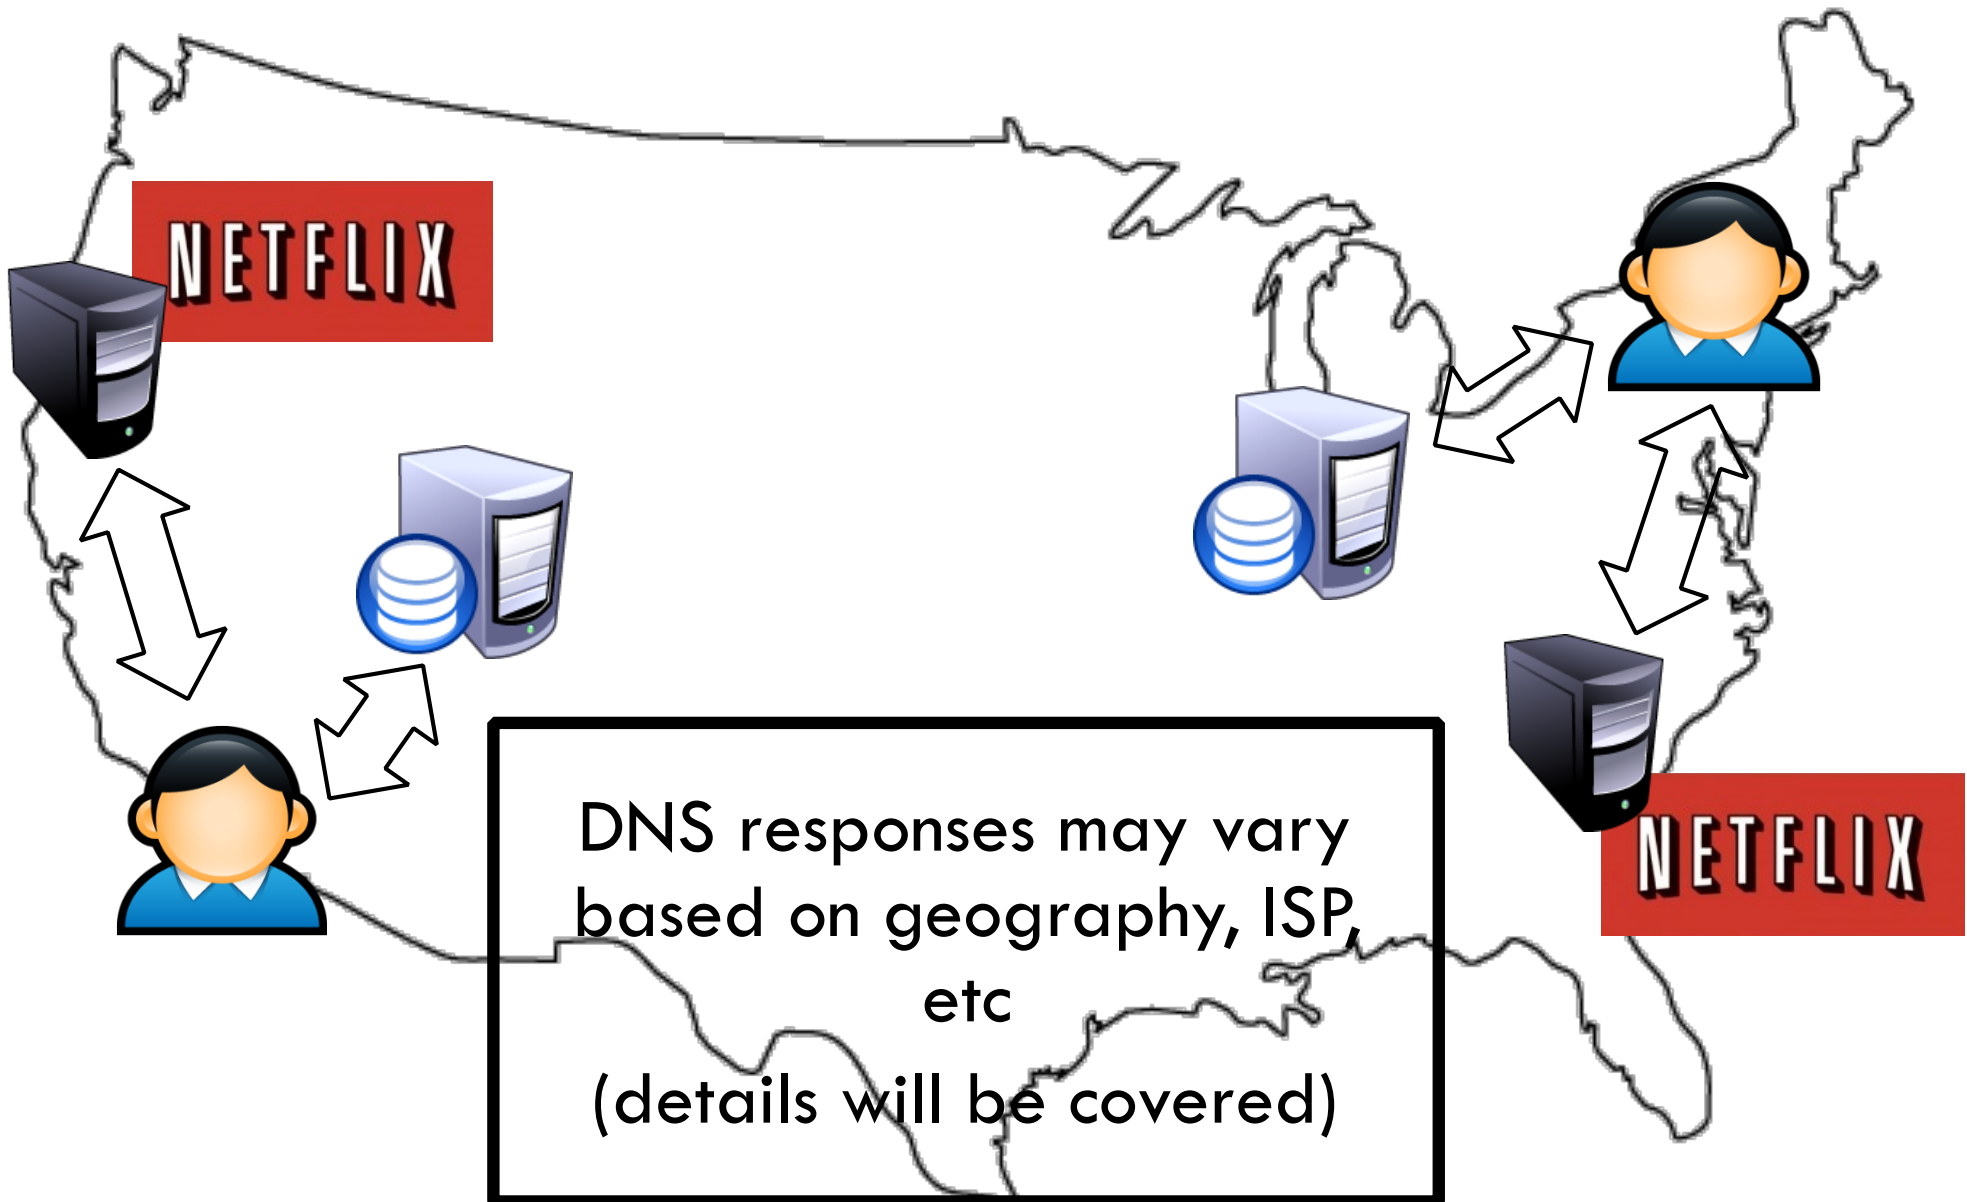

- One domain can map to multiple machines

# Content Delivery Networks

50

# 51 Outline

- ❑ DNS Basics
- ❑ DNS Security

# The Importance of DNS

52

- Without DNS...
  - ▣ How could you get to any websites?
- You are your mailserver
  - ▣ When you sign up for websites, you use your email address
  - ▣ What if someone hijacks the DNS for your mail server?
- DNS is the root of trust for the web
  - ▣ When a user types www.bankofamerica.com, they expect to be taken to their bank's website
  - ▣ What if the DNS record is compromised?

# Denial Of Service

53

- Flood DNS servers with requests until they fail
- October 2002: massive DDoS against the root name servers
  - ▣ What was the effect?
  - ▣ ... users didn't even notice
  - ▣ Root zone file is cached almost everywhere
- More targeted attacks can be effective
  - ▣ Local DNS server → cannot access DNS
  - ▣ Authoritative server → cannot access domain

# DNS Hijacking

54

- Infect their OS or browser with a virus/trojan
  - ▣ e.g. Many trojans change entries in /etc/hosts
  - ▣ \*.bankofamerica.com → evilbank.com
- Man-in-the-middle

- Response Spoofing
  - ▣ Eavesdrop on requests
  - ▣ Outrace the servers response

# DNS Spoofing

Where is  
bankofamerica.com?

123.45.67.89

How do you know that a given  
name  $\rightarrow$  IP mapping is correct?

Where is  
bankofamerica.com?

dns.bofa.com

66.66.66.93

123.45.67.89

dns.evilm.com

66.66.66.93

55

# DNS Cache Poisoning

56

Where is  
www.google.com?  
Where is  
bankofamerica.com?

dns.rit.edu

www.google.com =  
74.125.131.26

ns1.google.com

- Until the TTL expires, all queries for BofA to dns.rit.edu will return poisoned result

- Much worse than spoofing/man-in-the-middle

- ▣ Whole ISPs can be impacted!

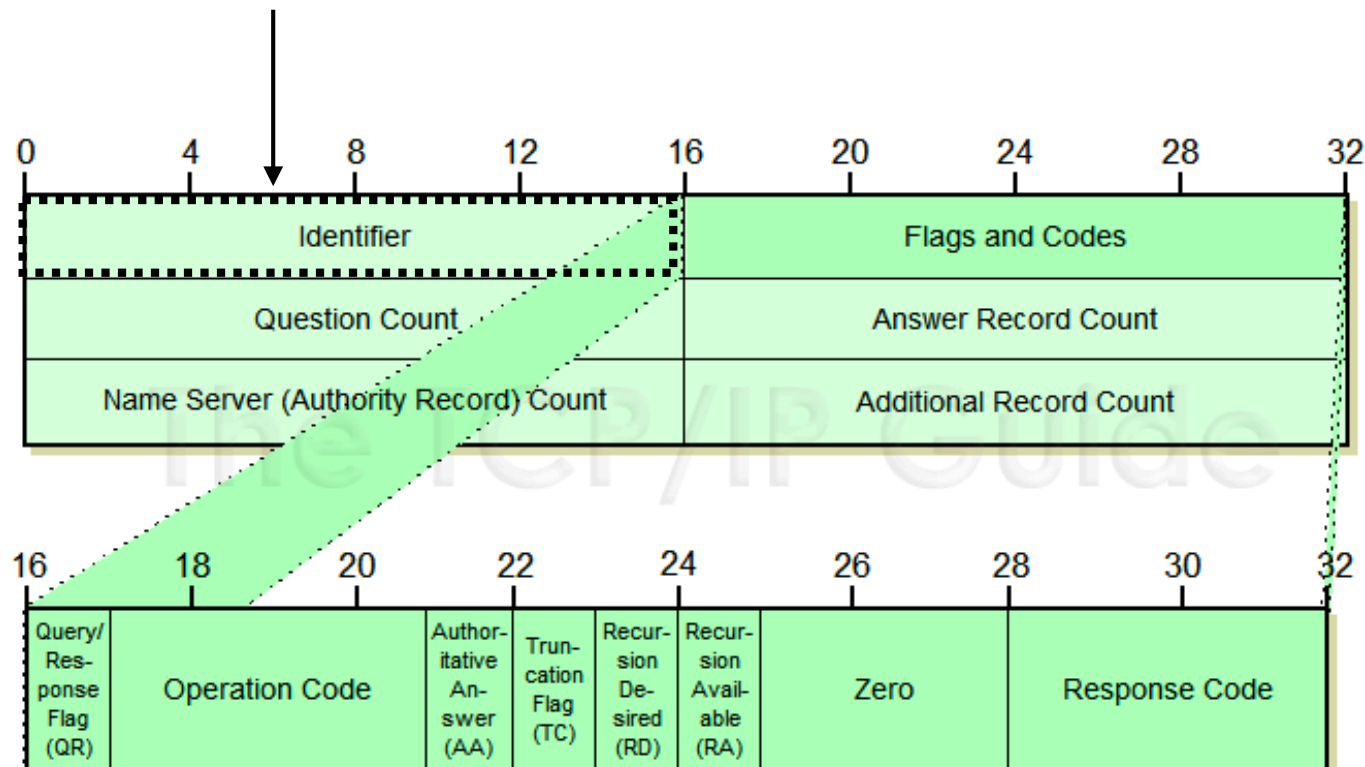

bankofamerica.com =  
66.66.66.92

# DNS Header

57

Query identifier: used to be incremented by 1

# Attacking DNS (only few examples)

58

Kaminsky Attack  
(QID bruteforcing)

Random QID and  
Random Port

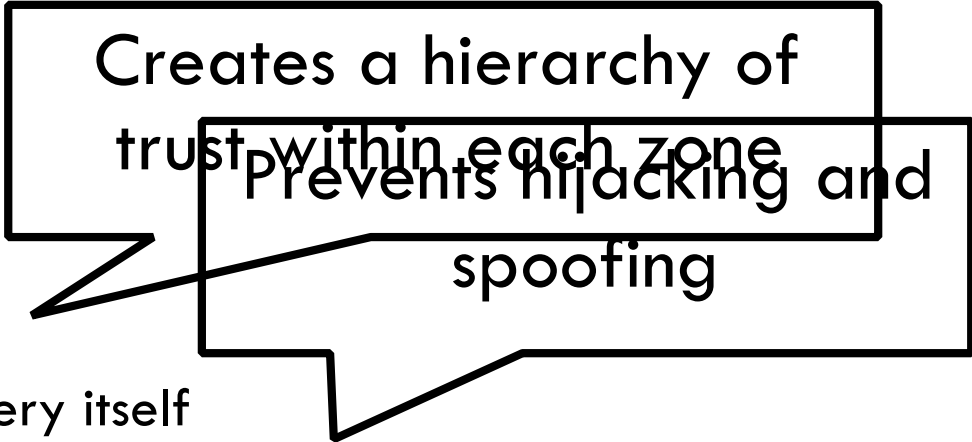

Man-in-the-Middle

# Solution: DNSSEC

59

- Cryptographically sign critical resource records
  - ▣ Resolver can verify the cryptographic signature
- Two new resource types
  - ▣ Type = DNSKEY
    - Name = Zone domain name
    - Value = Public key for the zone
  - ▣ Type = RRSIG
    - Name = (type, name) tuple, i.e. the query itself
    - Value = Cryptographic signature of the query results
- Deployment
  - ▣ On the roots since July 2010
  - ▣ Verisign enabled it on .com and .net in January 2011
  - ▣ Comcast is the first major ISP to support it (January 2012)

Creates a hierarchy of trust within each zone  
Prevents hijacking and spoofing

# DNSSEC Hierarchy of Trust

60

# Site Finder

61

- September 2003: Verisign created DNS wildcards for \*.com and \*.net
